Two-Wire Hall-Effect Sensor Family Sensor Family in CMOS technology

Release Note: Revision bars indicate significant changes to the previous edition.

1. Introduction

This sensor family consists of different two-wire Hall switches produced in CMOS technology. All sensors change the current consumption depending on the external magnetic field and require only two wires between sensor and evaluation circuit. The sensors of this family differ in the magnetic switching behavior and switching points.

The sensors include a temperature-compensated Hall plate with active offset compensation, a comparator, and a current source. The comparator compares the actual magnetic flux through the Hall plate (Hall voltage) with the fixed reference values (switching points). Accordingly, the current source is switched on (high current consumption) or off (low current consumption).

The active offset compensation leads to constant magnetic characteristics in the full supply voltage and temperature range. In addition, the magnetic parameters are robust against mechanical stress effects.

The sensors are designed for industrial and automotive applications and operate with supply voltages from 4 V to 24 V in the junction temperature range from $-40\text{ }^{\circ}\text{C}$ up to $140\text{ }^{\circ}\text{C}$. All sensors are available in the SMD-package SOT89B-1 and in the leaded versions TO92UA-1 and TO92UA-2.

1.1. Features

- current output for two-wire applications
- junction temperature range from $-40\text{ }^{\circ}\text{C}$ up to $140\text{ }^{\circ}\text{C}$.
- operates from 4 V to 24 V supply voltage
- operates with static magnetic fields and dynamic magnetic fields up to 10 kHz
- switching offset compensation at typically 145 kHz
- overvoltage and reverse-voltage protection
- magnetic characteristics are robust against mechanical stress effects
- constant magnetic switching points over a wide supply voltage range
- the decrease of magnetic flux density caused by rising temperature in the sensor system is compensated by a built-in negative temperature coefficient of the magnetic characteristics
- ideal sensor for applications in extreme automotive and industrial environments
- EMC corresponding to ISO 7637

1.2. Family Overview

The types differ according to the mode of switching and the magnetic switching points.

Type	Switching Behavior	Sensitivity	see Page
556	unipolar	very high	18
560	unipolar inverted	low	20
566	unipolar inverted	very high	22

Unipolar Switching Sensors:

The sensor turns to high current consumption with the magnetic south pole on the branded side of the package and turns to low consumption if the magnetic field is removed. The sensor does not respond to the magnetic north pole on the branded side.

Unipolar Inverted Switching Sensors:

The sensor turns to low current consumption with the magnetic south pole on the branded side of the package and turns to high consumption if the magnetic field is removed. The sensor does not respond to the magnetic north pole on the branded side.

1.3. Marking Code

All Hall sensors have a marking on the package surface (branded side). This marking includes the name of the sensor and the temperature range.

Type	Temperature Range	
	K	E
HAL556	556K	556E
HAL560	560K	560E
HAL566	566K	566E

1.4. Operating Junction Temperature Range

The Hall sensors from Micronas are specified to the chip temperature (junction temperature T_J).

K: $T_J = -40\text{ °C to }+140\text{ °C}$

E: $T_J = -40\text{ °C to }+100\text{ °C}$

Note: Due to the high power dissipation at high current consumption, there is a difference between the ambient temperature (T_A) and junction temperature. Please refer to section 5.4. on page 25 for details.

1.5. Hall Sensor Package Codes

HALXXXPA-T

Temperature Range: K or E

Package: SF for SOT89B-1
UA for TO92UA

Type: 556, 560, or 566

Example: **HAL556UA-E**

- Type: 556
- Package: TO92UA
- Temperature Range: $T_J = -40\text{ °C to }+100\text{ °C}$

Hall sensors are available in a wide variety of packaging versions and quantities. For more detailed information, please refer to the brochure: "Hall Sensors: Ordering Codes, Packaging, Handling".

1.6. Solderability and Welding

Soldering

During soldering reflow processing and manual reworking, a component body temperature of 260 °C should not be exceeded.

Welding

Device terminals should be compatible with laser and resistance welding. Please note that the success of the welding process is subject to different welding parameters which will vary according to the welding technique used. A very close control of the welding parameters is absolutely necessary in order to reach satisfying results. Micronas, therefore, does not give any implied or express warranty as to the ability to weld the component.

Fig. 1–1: Pin configuration

2. Functional Description

The HAL55x, HAL56x two-wire sensors are monolithic integrated circuits which switch in response to magnetic fields. If a magnetic field with flux lines perpendicular to the sensitive area is applied to the sensor, the biased Hall plate forces a Hall voltage proportional to this field. The Hall voltage is compared with the actual threshold level in the comparator. The temperature-dependent bias increases the supply voltage of the Hall plates and adjusts the switching points to the decreasing induction of magnets at higher temperatures.

If the magnetic field exceeds the threshold levels, the current source switches to the corresponding state. In the low current consumption state, the current source is switched off and the current consumption is caused only by the current through the Hall sensor. In the high current consumption state, the current source is switched on and the current consumption is caused by the current through the Hall sensor and the current source. The built-in hysteresis eliminates oscillation and provides switching behavior of the output signal without bouncing.

Magnetic offset caused by mechanical stress is compensated for by using the “switching offset compensation technique”. An internal oscillator provides a two-phase clock. In each phase, the current is forced through the Hall plate in a different direction, and the Hall voltage is measured. At the end of the two phases, the Hall voltages are averaged and thereby the offset voltages are eliminated. The average value is compared with the fixed switching points. Subsequently, the current consumption switches to the corresponding state. The amount of time elapsed from crossing the magnetic switching level to switching of the current level can vary between zero and $1/f_{osc}$.

Shunt protection devices clamp voltage peaks at the V_{DD} -pin together with external series resistors. Reverse current is limited at the V_{DD} -pin by an internal series resistor up to -15 V. No external protection diode is needed for reverse voltages ranging from 0 V to -15 V.

3.2. Dimensions of Sensitive Area

0.25 mm × 0.12 mm

3.3. Positions of Sensitive Areas

	SOT89B-1	TO92UA-1/-2
y	0.95 mm nominal	1.0 mm nominal
A4	0.3 mm nominal	0.3 mm nominal
D1		3.05 mm ±50 μm

3.4. Absolute Maximum Ratings

Stresses beyond those listed in the “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only. Functional operation of the device at these conditions is not implied. Exposure to absolute maximum rating conditions for extended periods will affect device reliability.

This device contains circuitry to protect the inputs and outputs against damage due to high static voltages or electric fields; however, it is advised that normal precautions be taken to avoid application of any voltage higher than absolute maximum-rated voltages to this circuit.

All voltages listed are referenced to ground (GND).

Symbol	Parameter	Pin No.	Min.	Max.	Unit
V _{DD}	Supply Voltage	1	−15 ¹⁾²⁾	28 ²⁾	V
T _J	Junction Temperature Range		−40	170	°C
¹⁾ −18 V with a 100 Ω series resistor at pin 1 (−16 V with a 30 Ω series resistor) ²⁾ as long as T _{Jmax} is not exceeded					

3.4.1. Storage and Shelf Life

The permissible storage time (shelf life) of the sensors is unlimited, provided the sensors are stored at a maximum of 30 °C and a maximum of 85% relative humidity. At these conditions, no Dry Pack is required.

Solderability is guaranteed for one year from the date code on the package.

3.5. Recommended Operating Conditions

Functional operation of the device beyond those indicated in the “Recommended Operating Conditions” of this specification is not implied, may result in unpredictable behavior of the device and may reduce reliability and lifetime.

All voltages listed are referenced to ground (GND).

Symbol	Parameter	Pin No.	Min.	Max.	Unit
V _{DD}	Supply Voltage	1	4	24	V
T _A	Ambient Temperature for Continuous Operations		−40	85 ¹⁾	°C
¹⁾ when using the “K” type and V _{DD} ≤ 16 V					

Note: Due to the high power dissipation at high current consumption, there is a difference between the ambient temperature (T_A) and junction temperature. The power dissipation can be reduced by repeatedly switching the supply voltage on and off (pulse mode). Please refer to section 5.4. on page 25 for details.

3.6. Characteristics

at $T_J = -40\text{ }^{\circ}\text{C}$ to $+140\text{ }^{\circ}\text{C}$, $V_{DD} = 4\text{ V}$ to 24 V , $GND = 0\text{ V}$,
at Recommended Operation Conditions if not otherwise specified in the column “Conditions”.
Typical Characteristics for $T_J = 25\text{ }^{\circ}\text{C}$ and $V_{DD} = 12\text{ V}$.

Symbol	Parameter	Pin No.	Min.	Typ.	Max.	Unit	Conditions

4. Type Description

4.1. HAL556

The HAL556 is a very sensitive unipolar switching sensor (see Fig. 4–1).

The sensor turns to high current consumption with the magnetic south pole on the branded side of the package and turns to low current consumption if the magnetic field is removed. It does not respond to the magnetic north pole on the branded side.

For correct functioning in the application, the sensor requires only the magnetic south pole on the branded side of the package.

In the HAL55x, HAL56x two-wire sensor family, the HAL566 is a sensor with the same magnetic characteristics but with an inverted output characteristic.

Magnetic Features:

- switching type: unipolar
- very high sensitivity
- typical B_{ON} : 6 mT at room temperature
- typical B_{OFF} : 4 mT at room temperature
- operates with static magnetic fields and dynamic magnetic fields up to 10 kHz

Applications

The HAL556 is designed for applications with one magnetic polarity and weak magnetic amplitudes at the sensor position such as:

- applications with large airgap or weak magnets,
- solid state switches,
- contactless solutions to replace micro switches,
- position and end point detection, and
- rotating speed measurement.

Fig. 4–1: Definition of magnetic switching points for the HAL556

Magnetic Characteristics at $T_J = -40\text{ °C}$ to $+140\text{ °C}$, $V_{DD} = 4\text{ V}$ to 24 V ,
Typical Characteristics for $V_{DD} = 12\text{ V}$

Magnetic flux density values of switching points.

Positive flux density values refer to the magnetic south pole at the branded side of the package.

Parameter T_J	On point B_{ON}			Off point B_{OFF}			Hysteresis B_{HYS}			Magnetic Offset			Unit
	Min.	Typ.	Max.	Min.	Typ.	Max.	Min.	Typ.	Max.	Min.	Typ.	Max.	
-40 °C	3.4	6.3	7.7	2.1	4.2	5.9	0.8	2.1	3		5.2		mT
25 °C	3.4	6	7.4	2	3.8	5.7	0.5	1.8	2.8	2.7	4.9	6.5	mT
100 °C	3.2	5.5	7.2	1.9	3.7	5.7	0.3	1.8	2.8		4.6		mT
140 °C	3	5.2	7.4	1.2	3.6	6	0.2	1.6	3		4.4		mT

The hysteresis is the difference between the switching points $B_{HYS} = B_{ON} - B_{OFF}$

The magnetic offset is the mean value of the switching points $B_{OFFSET} = (B_{ON} + B_{OFF}) / 2$

Fig. 4-2: Typ. magnetic switching points versus supply voltage

Fig. 4-4: Magnetic switching points versus temperature

Fig. 4-3: Typ. magnetic switching points versus supply voltage

Note: In the diagram “Magnetic switching points versus temperature”, the curves for B_{ONmin} , B_{ONmax} , B_{OFFmin} , and B_{OFFmax} refer to junction temperature, whereas typical curves refer to ambient temperature.

4.2. HAL560

The HAL560 is a low-sensitive unipolar switching sensor with an inverted output (see Fig. 4–5).

The sensor turns to low current consumption with the magnetic south pole on the branded side of the package and turns to high current consumption if the magnetic field is removed. It does not respond to the magnetic north pole on the branded side.

For correct functioning in the application, the sensor requires only the magnetic south pole on the branded side of the package.

Magnetic Features:

- switching type: unipolar inverted
- low sensitivity
- typical B_{ON} : 45.6 mT at room temperature
- typical B_{OFF} : 51.7 mT at room temperature
- operates with static magnetic fields and dynamic magnetic fields up to 10 kHz

Applications

The HAL560 is designed for applications with one magnetic polarity and strong magnetic amplitudes at the sensor position where an inverted output signal is required such as:

- applications with strong magnets,
- solid state switches,
- contactless solutions to replace micro switches,
- position and end point detection, and
- rotating speed measurement.

Fig. 4–5: Definition of magnetic switching points for the HAL560

Magnetic Characteristics at $T_J = -40\text{ }^{\circ}\text{C}$ to $+140\text{ }^{\circ}\text{C}$, $V_{DD} = 4\text{ V}$ to 24 V ,
Typical Characteristics for $V_{DD} = 12\text{ V}$

Magnetic flux density values of switching points.

Positive flux density values refer to the magnetic south pole at the branded side of the package.

Parameter T_J	On point B_{ON}			Off point B_{OFF}			Hysteresis B_{HYS}			Magnetic Offset			Unit
	Min.	Typ.	Max.	Min.	Typ.	Max.	Min.	Typ.	Max.	Min.	Typ.	Max.	
$-40\text{ }^{\circ}\text{C}$	41	46.5	52	47	53	59	4	6.5	10		49.8		mT
$25\text{ }^{\circ}\text{C}$	41	46.5	52	46	52.5	58.5	3	6	9		49.5		mT
$100\text{ }^{\circ}\text{C}$	41	45.7	52	45	51.1	57.5	2	5.4	8		48.4		mT
$140\text{ }^{\circ}\text{C}$	39	44.8	51	43.5	49.8	56.5	2	5	8		47.3		mT

The hysteresis is the difference between the switching points $B_{HYS} = B_{ON} - B_{OFF}$

The magnetic offset is the mean value of the switching points $B_{OFFSET} = (B_{ON} + B_{OFF}) / 2$

Fig. 4-6: Typ. magnetic switching points versus supply voltage

Fig. 4-8: Magnetic switching points versus temperature

Fig. 4-7: Typ. magnetic switching points versus supply voltage

Note: In the diagram “Magnetic switching points versus temperature”, the curves for B_{ONmin} , B_{ONmax} , B_{OFFmin} , and B_{OFFmax} refer to junction temperature, whereas typical curves refer to ambient temperature.

4.3. HAL566

The HAL566 is a very sensitive unipolar switching sensor with an inverted output (see Fig. 4–9).

The sensor turns to low current consumption with the magnetic south pole on the branded side of the package and turns to high current consumption if the magnetic field is removed. It does not respond to the magnetic north pole on the branded side.

For correct functioning in the application, the sensor requires only the magnetic south pole on the branded side of the package.

In the HAL55x, HAL56x two-wire sensor family, the HAL556 is a sensor with the same magnetic characteristics but with a normal output characteristic.

Magnetic Features:

- switching type: unipolar inverted
- high sensitivity
- typical B_{ON} : 4 mT at room temperature
- typical B_{OFF} : 5.9 mT at room temperature
- operates with static magnetic fields and dynamic magnetic fields up to 10 kHz

Applications

The HAL566 is designed for applications with one magnetic polarity and weak magnetic amplitudes at the sensor position where an inverted output signal is required such as:

- applications with large airgap or weak magnets,
- solid state switches,
- contactless solutions to replace micro switches,
- position and end point detection, and
- rotating speed measurement.

Fig. 4–9: Definition of magnetic switching points for the HAL566

Magnetic Characteristics at $T_J = -40\text{ }^{\circ}\text{C}$ to $+140\text{ }^{\circ}\text{C}$, $V_{DD} = 4\text{ V}$ to 24 V ,
Typical Characteristics for $V_{DD} = 12\text{ V}$

Magnetic flux density values of switching points.

Positive flux density values refer to the magnetic south pole at the branded side of the package.

Parameter T_J	On point B_{ON}			Off point B_{OFF}			Hysteresis B_{HYS}			Magnetic Offset			Unit
	Min.	Typ.	Max.	Min.	Typ.	Max.	Min.	Typ.	Max.	Min.	Typ.	Max.

Note: In the diagram “Magnetic switching points versus temperature”, the curves for B_{ONmin} , B_{ONmax} , B_{OFFmin} , and B_{OFFmax} refer to junction temperature, whereas typical curves refer to ambient temperature.

5. Application Notes

5.1. Application Circuit

Figure 5–1 shows a simple application with a two-wire sensor. The current consumption can be detected by measuring the voltage over R_L . For correct functioning of the sensor, the voltage between pin 1 and 2 (V_{DD}) must be a minimum of 4 V. With the maximum current consumption of 17 mA, the maximum R_L can be calculated as:

$$R_{Lmax} = \frac{V_{SUPmin} - 4V}{17mA}$$

Fig. 5–1: Application circuit 1

For applications with disturbances on the supply line or radiated disturbances, a series resistor R_V (ranging from 10 Ω to 30 Ω) and a capacitor both placed close to the sensor are recommended (see Fig. 5–2). In this case, the maximum R_L can be calculated as:

$$R_{Lmax} = \frac{V_{SUPmin} - 4V}{17mA} - R_V$$

Fig. 5–2: Application circuit 2

5.2. Extended Operating Conditions

All sensors fulfill the electrical and magnetic characteristics when operated within the Recommended Operating Conditions (see page 13).

Typically, the sensors operate with supply voltages above 3 V. However, below 4 V, the current consumption and the magnetic characteristics may be outside the specification.

Note: The functionality of the sensor below 4 V is not tested on a regular base. For special test conditions, please contact Micronas.

5.3. Start-up Behavior

Due to the active offset compensation, the sensors have an initialization time (enable time $t_{en(O)}$) after applying the supply voltage. The parameter $t_{en(O)}$ is specified in the Electrical Characteristics (see page 14). During the initialization time, the current consumption is not defined and can toggle between low and high.

HAL55x:

After $t_{en(O)}$, the current consumption will be high if the applied magnetic field B is above B_{ON} . The current consumption will be low if B is below B_{OFF} .

HAL56x:

In case of sensors with an inverted switching behavior, the current consumption will be low if $B > B_{OFF}$ and high if $B < B_{ON}$.

Note: For magnetic fields between B_{OFF} and B_{ON} , the current consumption of the HAL sensor will be either low or high after applying V_{DD} . In order to achieve a defined current consumption, the applied magnetic field must be above B_{ON} , respectively, below B_{OFF} .

5.4. Ambient Temperature

Due to internal power dissipation, the temperature on the silicon chip (junction temperature T_J) is higher than the temperature outside the package (ambient temperature T_A).

$$T_J = T_A + \Delta T$$

Under static conditions and continuous operation, the following equation applies:

$$\Delta T = I_{DD} \times V_{DD} \times R_{TH}$$

For all sensors, the junction temperature range T_J is specified. The maximum ambient temperature T_{Amax} can be calculated as:

$$T_{Amax} = T_{Jmax} - \Delta T$$

For typical values, use the typical parameters. For worst case calculation, use the max. parameters for I_{DD} and R_{th} , and the max. value for V_{DD} from the application.

Due to the range of I_{DDhigh} , self-heating can be critical. The junction temperature can be reduced with pulsed supply voltage. For supply times (t_{on}) ranging from 30 μs to 1 ms, the following equation can be used:

$$\Delta T = I_{DD} \times V_{DD} \times R_{th} \times \frac{t_{on}}{t_{off} + t_{on}}$$

5.5. EMC and ESD

For applications with disturbances on the supply line or radiated disturbances, a series resistor and a capacitor are recommended (see Fig. 5–3). The series resistor and the capacitor should be placed as closely as possible to the HAL sensor.

Applications with this arrangement passed the EMC tests according to the product standard ISO 7637.

Please contact Micronas for the detailed investigation reports with the EMC and ESD results.

6. Data Sheet History

1. Data sheet: "HAL54x Hall-Effect Sensor Family", Nov. 27, 2002, 6251-605-1DS. First release of the data sheet.
2. Data sheet: "HAL556, HAL560, HAL566, Two-Wire Hall-Effect Sensor Family, Aug. 3, 2000, 6251-425-2DS. Second release of the data sheet. Major changes:
 - magnetic characteristics for HAL556 and HAL560 changed. Please refer to pages 12 and 14 for details.
 - new temperature ranges "K" and "A" added
 - temperature range "C" removed
 - outline dimensions for SOT-89B: reduced tolerances
 - SMD package SOT-89A removed
3. Data sheet: "HAL556, HAL560, HAL566, Two-Wire Hall-Effect Sensor Family, Jan. 28, 2003, 6251-425-3DS. Third release of the data sheet. Major changes:
 - temperature range "A" removed
 - outline dimensions for TO-92UA changed
4. Data sheet: "HAL556, HAL560, HAL566, Two-Wire Hall-Effect Sensor Family, May 14, 2004, 6251-425-4DS (DSH000026_001EN). Fourth release of the data sheet. Major changes:
 - new package diagrams for SOT89B-1 and TO92UA-1
 - package diagram for TO92UA-2 added
 - ammopack diagrams for TO92UA-1/-2 added
5. Data Sheet: "HAL556, HAL566 Two-Wire Hall-Effect Sensor Family", Dec. 19, 2008, DSH000026_002EN. Fifth release of the data sheet. Major changes:
 - Section 1.6. on page 5 "Solderability and Welding" updated
 - all package diagrams updated
 - recommended footprint SOT89B-1 added
 - HAL 560 removed.
6. Data Sheet: "HAL556, HAL560, HAL566 Two-Wire Hall-Effect Sensor Family", Feb. 12, 2009, DSH000026_004EN. Sixth release of the data sheet. Minor changes:
 - Section 3.3. "Positions of Sensitive Areas" updated (parameter A4 for SOT89B-1 was added).
7. Data Sheet: "HAL556, HAL560, HAL566 Two-Wire Hall-Effect Sensor Family", July 30, 2009, DSH000026_004EN. Seventh release of the data sheet. Major changes:
 - Package outlines updated
 - HAL 560 added.

**Стандарт
Электрон
Связь**

Мы молодая и активно развивающаяся компания в области поставок электронных компонентов. Мы поставляем электронные компоненты отечественного и импортного производства напрямую от производителей и с крупнейших складов мира.

Благодаря сотрудничеству с мировыми поставщиками мы осуществляем комплексные и плановые поставки широчайшего спектра электронных компонентов.

Собственная эффективная логистика и склад в обеспечивает надежную поставку продукции в точно указанные сроки по всей России.

Мы осуществляем техническую поддержку нашим клиентам и предпродажную проверку качества продукции. На все поставляемые продукты мы предоставляем гарантию .

Осуществляем поставки продукции под контролем ВП МО РФ на предприятия военно-промышленного комплекса России , а также работаем в рамках 275 ФЗ с открытием отдельных счетов в уполномоченном банке. Система менеджмента качества компании соответствует требованиям ГОСТ ISO 9001.

Минимальные сроки поставки, гибкие цены, неограниченный ассортимент и индивидуальный подход к клиентам являются основой для выстраивания долгосрочного и эффективного сотрудничества с предприятиями радиоэлектронной промышленности, предприятиями ВПК и научно-исследовательскими институтами России.

С нами вы становитесь еще успешнее!
