

Mobile 5th Generation Intel® Core™ Processor Family

Datasheet – Volume 1 of 2

Supporting 5th Generation Intel® Core™ Processor based on Mobile H-Processor Line

June 2015

You may not use or facilitate the use of this document in connection with any infringement or other legal analysis concerning Intel products described herein. You agree to grant Intel a non-exclusive, royalty-free license to any patent claim thereafter drafted which includes subject matter disclosed herein.

No license (express or implied, by estoppel or otherwise) to any intellectual property rights is granted by this document.

All information provided here is subject to change without notice. Contact your Intel representative to obtain the latest Intel product specifications and roadmaps.

The products described may contain design defects or errors known as errata which may cause the product to deviate from published specifications. Current characterized errata are available on request.

Copies of documents which have an order number and are referenced in this document may be obtained by calling 1-800-548-4725 or visit <http://www.intel.com/design/literature.htm>.

Intel technologies' features and benefits depend on system configuration and may require enabled hardware, software or service activation. Learn more at <http://www.intel.com/> or from the OEM or retailer.

No computer system can be absolutely secure.

Intel® Hyper-Threading Technology (Intel® HT Technology) is available on select Intel® Core™ processors. It requires an Intel® HT Technology enabled system. Consult your PC manufacturer. Performance will vary depending on the specific hardware and software used. Not available on Intel® Core™ i5-750. For more information including details on which processors support Intel® HT Technology, visit <http://www.intel.com/info/hyperthreading>.

Intel® High Definition Audio (Intel® HD Audio) requires an Intel® HD Audio enabled system. Consult your PC manufacturer for more information. Sound quality will depend on equipment and actual implementation. For more information about Intel® HD Audio, refer to <http://www.intel.com/design/chipsets/hdaudio.htm>.

Intel® 64 architecture requires a system with a 64-bit enabled processor, chipset, BIOS and software. Performance will vary depending on the specific hardware and software you use. Consult your PC manufacturer for more information. For more information, visit <http://www.intel.com/content/www/us/en/architecture-and-technology/microarchitecture/intel-64-architecture-general.html>.

Intel® Virtualization Technology (Intel® VT) requires a computer system with an enabled Intel® processor, BIOS, and virtual machine monitor (VMM). Functionality, performance or other benefits will vary depending on hardware and software configurations. Software applications may not be compatible with all operating systems. Consult your PC manufacturer. For more information, visit <http://www.intel.com/go/virtualization>.

The original equipment manufacturer must provide TPM functionality, which requires a TPM-supported BIOS. TPM functionality must be initialized and may not be available in all countries.

For Enhanced Intel SpeedStep® Technology, see the Processor Spec Finder at <http://ark.intel.com/> or contact your Intel representative for more information.

Intel® AES-NI requires a computer system with an AES-NI enabled processor, as well as non-Intel software to execute the instructions in the correct sequence. AES-NI is available on select Intel® processors. For availability, consult your reseller or system manufacturer. **For more information, see** <http://software.intel.com/en-us/articles/intel-advanced-encryption-standard-instructions-aes-ni/>.

Intel® Active Management Technology (Intel® AMT) should be used by a knowledgeable IT administrator and requires enabled systems, software, activation, and connection to a corporate network. Intel AMT functionality on mobile systems may be limited in some situations. Your results will depend on your specific implementation. Learn more by visiting [Intel® Active Management Technology](#).

No computer system can provide absolute security under all conditions. Intel® Trusted Execution Technology (Intel® TXT) requires a computer with Intel® Virtualization Technology, an Intel TXT-enabled processor, chipset, BIOS, Authenticated Code Modules and an Intel TXT-compatible measured launched environment (MLE). Intel TXT also requires the system to contain a TPM v1.s. For more information, visit <http://www.intel.com/technology/security>.

Requires a system with Intel® Turbo Boost Technology. Intel Turbo Boost Technology and Intel Turbo Boost Technology 2.0 are only available on select Intel® processors. Consult your PC manufacturer. Performance varies depending on hardware, software, and system configuration. For more information, visit <https://www-ssl.intel.com/content/www/us/en/architecture-and-technology/turbo-boost/turbo-boost-technology.html>.

Intel® Advanced Vector Extensions (Intel® AVX) are designed to achieve higher throughput to certain integer and floating point operations. Due to varying processor power characteristics, utilizing AVX instructions may cause a) some parts to operate at less than the rated frequency and b) some parts with Intel® Turbo Boost Technology 2.0 to not achieve any or maximum turbo frequencies. Performance varies depending on hardware, software, and system configuration and you should consult your system manufacturer for more information. Intel® Advanced Vector Extensions refers to Intel® AVX, Intel® AVX2 or Intel® AVX-512. For more information on Intel® Turbo Boost Technology 2.0, visit <https://www-ssl.intel.com/content/www/us/en/architecture-and-technology/turbo-boost/turbo-boost-technology.html>

1.0 Introduction

The 5th Generation Intel® Core™ processor based on Mobile H-Processor Line family are 64-bit, multi-core processors built on 14-nanometer process technology.

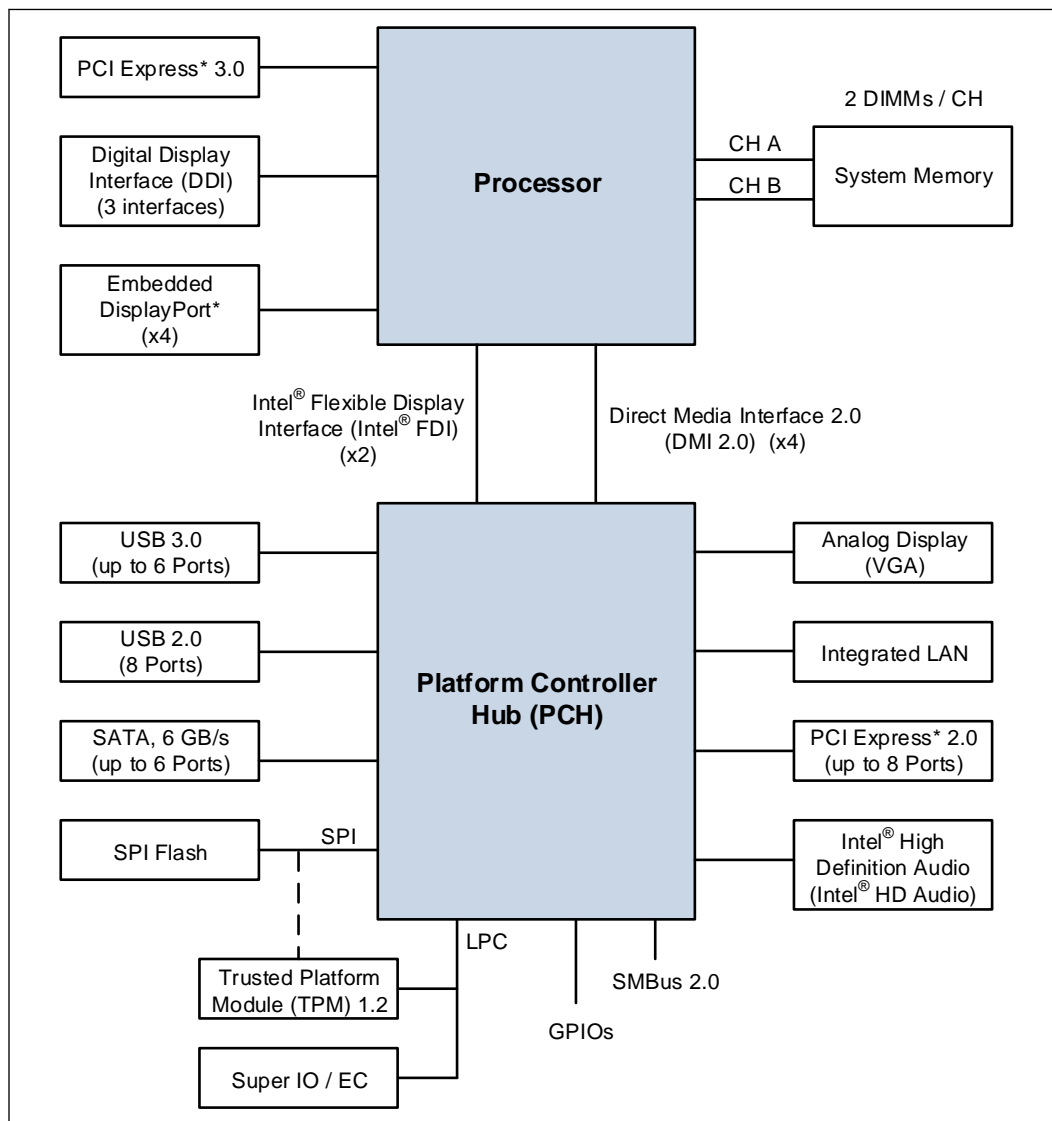

The processors are designed for a two-chip platform consisting of a processor and Platform Controller Hub (PCH). The processors are designed to be used with the Mobile Intel® 9 Series chipset. These processors are "drop-in" compatible with the 4th Generation Intel® Core™ processor based on Mobile M-Processor and H-Processor Lines. See the following figure for an example platform block diagram.

Throughout this document, the 5th Generation Intel® Core™ processor based on Mobile H-Processor Line family may be referred to simply as "processor".

Throughout this document, the 5th Generation Intel® Core™ processor based on Mobile H-Processor Line family refers to the Mobile 5th Generation Intel® Core™ i7-5950HQ, i7-5850HQ, i7-5750HQ, i7-5700HQ, i5-5350H processors.

Throughout this document, the Intel® 9 Series chipset may be referred to simply as "PCH".

Note: Refer to the processor Specification Update document for additional SKU details.

Figure 1. Platform Block Diagram

1.1 Supported Technologies

- On-package Cache Memory integrated within the processor based on Mobile H-Processor line with up to GT3 graphics
- Intel® Virtualization Technology (Intel® VT)
- Intel® Active Management Technology 10.0 (Intel® AMT)
- Intel® Trusted Execution Technology (Intel® TXT)
- Intel® Streaming SIMD Extensions 4.2 (Intel® SSE4.2)
- Intel® Hyper-Threading Technology (Intel® HT Technology)
- Intel® 64 Architecture

- Execute Disable Bit
- Intel® Turbo Boost Technology 2.0
- Intel® Advanced Vector Extensions 2.0 (Intel® AVX2)
- Intel® Device Protection Technology with Intel® Advanced Encryption Standard New Instructions (Intel® AES-NI)
- PCLMULQDQ Instruction
- Intel® Device Protection Technology with Intel® Secure Key
- Intel® Transactional Synchronization Extensions - New Instructions (Intel® TSX-NI)
- PAIR – Power Aware Interrupt Routing
- SMEP – Supervisor Mode Execution Protection
- SMAP – Supervisor Mode Access Protection
- Intel® Device Protection Technology with Boot Guard
- DRAM Bit-Error Recovery (DBER)
- Enhanced Intel® Speedstep® Technology

Note: The availability of the features may vary between processor SKUs.

1.2 Interfaces

The processor supports the following interfaces:

- DDR3L/DDR3L-RS
- Direct Media Interface (DMI)
- Digital Display Interface (DDI)
- PCI Express*

1.3 Power Management Support

Processor Core

- Full support of ACPI C-states as implemented by the following processor C-states:
 - C0, C1, C1E, C3, C6
- Enhanced Intel SpeedStep® Technology

System

- S0, S3, S4, S5

Memory Controller

- Conditional self-refresh
- Dynamic power-down

PCI Express*

- L0s and L1 ASPM power management capability

DMI

- L0s and L1 ASPM power management capability

Processor Graphics Controller

- Intel® Rapid Memory Power Management (Intel® RMPM)
- Intel® Smart 2D Display Technology (Intel® S2DDT)
- Graphics Render C-state (RC6)
- Intel® Seamless Display Refresh Rate Switching with eDP port
- Intel® Display Power Saving Technology (Intel® DPST)

1.4 Thermal Management Support

- Digital Thermal Sensor
- Adaptive Thermal Monitor
- THERMTRIP# and PROCHOT# support
- On-Demand Mode
- Memory Open and Closed Loop Throttling
- Memory Thermal Throttling
- External Thermal Sensor (TS-on-DIMM and TS-on-Board)
- Render Thermal Throttling
- Fan speed control with DTS

1.5 Package Support

The Mobile processor is available in the following package:

- 37.5 mm x 32 mm BGA package (BGA1364)

1.6 Processor Testability

The processor includes boundary-scan for board and system level testability.

1.7 Terminology

Table 1. Terminology

Term	Description
APD	Active Power-down
B/D/F	Bus/Device/Function
BGA	Ball Grid Array
BLC	Backlight Compensation
BLT	Block Level Transfer
BPP	Bits per pixel
<i>continued...</i>	

Term	Description
CKE	Clock Enable
CLTM	Closed Loop Thermal Management
DDI	Digital Display Interface
DDR3	Third-generation Double Data Rate SDRAM memory technology
DDR3L	DDR3 Low Voltage
DDR3L-RS	DDR3 Low Voltage Reduced Standby Power
DLL	Delay-Locked Loop
DMA	Direct Memory Access
DMI	Direct Media Interface
DP	DisplayPort*
DTS	Digital Thermal Sensor
DVI*	Digital Visual Interface. DVI* is the interface specified by the DDWG (Digital Display Working Group)
EC	Embedded Controller
ECC	Error Correction Code
eDP*	embedded DisplayPort*
EPG	Electrical Power Gating
EU	Execution Unit
FMA	Floating-point fused Multiply Add instructions
FSC	Fan Speed Control
HDCP	High-bandwidth Digital Content Protection
HDMI*	High Definition Multimedia Interface
HFM	High Frequency Mode
iDCT	Inverse Discrete Cosine Transform
IHS	Integrated Heat Spreader
GFX	Graphics
GSA	Graphics in System Agent
GUI	Graphical User Interface
IMC	Integrated Memory Controller
Intel® 64 Technology	64-bit memory extensions to the IA-32 architecture
Intel® DPST	Intel Display Power Saving Technology
Intel® FDI	Intel Flexible Display Interface
Intel® TSX-NI	Intel Transactional Synchronization Extensions - New Instructions
Intel® TXT	Intel Trusted Execution Technology
Intel® VT	Intel Virtualization Technology. Processor virtualization, when used in conjunction with Virtual Machine Monitor software, enables multiple, robust independent software environments inside a single platform.
continued...	

Term	Description
Intel® VT-d	Intel Virtualization Technology (Intel VT) for Directed I/O. Intel VT-d is a hardware assist, under system software (Virtual Machine Manager or OS) control, for enabling I/O device virtualization. Intel VT-d also brings robust security by providing protection from errant DMAs by using DMA remapping, a key feature of Intel VT-d.
IOV	I/O Virtualization
ISI	Inter-Symbol Interference
ITPM	Integrated Trusted Platform Module
LCD	Liquid Crystal Display
LFM	Low Frequency Mode. LFM is Pn in the P-state table. It can be read at MSR CEh [47:40].
LFP	Local Flat Panel
LPDDR3	Low-Power Third-generation Double Data Rate SDRAM memory technology
MCP	Multi-Chip Package
MFM	Minimum Frequency Mode. MFM is the minimum ratio supported by the processor and can be read from MSR CEh [55:48].
MLE	Measured Launched Environment
MLC	Mid-Level Cache
MSI	Message Signaled Interrupt
MSL	Moisture Sensitive Labeling
MSR	Model Specific Registers
NCTF	Non-Critical to Function. NCTF locations are typically redundant ground or non-critical reserved, so the loss of the solder joint continuity at end of life conditions will not affect the overall product functionality.
ODT	On-Die Termination
OLTM	Open Loop Thermal Management
PCG	Platform Compatibility Guide (PCG) (previously known as FMB) provides a design target for meeting all planned processor frequency requirements.
PCH	Platform Controller Hub. The chipset with centralized platform capabilities including the main I/O interfaces along with display connectivity, audio features, power management, manageability, security, and storage features.
PECI	The Platform Environment Control Interface (PECI) is a one-wire interface that provides a communication channel between Intel processor and chipset components to external monitoring devices.
Ψ_{ca}	Case-to-ambient thermal characterization parameter (psi). A measure of thermal solution performance using total package power. Defined as $(T_{CASE} - T_{LA}) / \text{Total Package Power}$.
PEG	PCI Express* Graphics. External Graphics using PCI Express* Architecture. It is a high-speed serial interface where configuration is software compatible with the existing PCI specifications.
PL1, PL2	Power Limit 1 and Power Limit 2
PPD	Pre-charge Power-down
Processor	The 64-bit multi-core component (package)
continued...	

Term	Description
Processor Core	The term “processor core” refers to Si die itself, which can contain multiple execution cores. Each execution core has an instruction cache, data cache, and 256-KB L2 cache. All execution cores share the L3 cache.
Processor Graphics	Intel Processor Graphics
Rank	A unit of DRAM corresponding to four to eight devices in parallel, ignoring ECC. These devices are usually, but not always, mounted on a single side of a SO-DIMM.
SCI	System Control Interrupt. SCI is used in the ACPI protocol.
SF	Strips and Fans
SMM	System Management Mode
SMX	Safer Mode Extensions
Storage Conditions	A non-operational state. The processor may be installed in a platform, in a tray, or loose. Processors may be sealed in packaging or exposed to free air. Under these conditions, processor landings should not be connected to any supply voltages, have any I/Os biased, or receive any clocks. Upon exposure to “free air” (that is, unsealed packaging or a device removed from packaging material), the processor must be handled in accordance with moisture sensitivity labeling (MSL) as indicated on the packaging material.
SVID	Serial Voltage Identification
TAC	Thermal Averaging Constant
TAP	Test Access Point
T _{CASE}	The case temperature of the processor, measured at the geometric center of the top-side of the TTV IHS.
TCC	Thermal Control Circuit
T _{CONTROL}	T _{CONTROL} is a static value that is below the TCC activation temperature and used as a trigger point for fan speed control. When DTS > T _{CONTROL} , the processor must comply to the TTV thermal profile.
TDP	Thermal Design Power: Thermal solution should be designed to dissipate this target power level. TDP is not the maximum power that the processor can dissipate.
TLB	Translation Look-aside Buffer
TTV	Thermal Test Vehicle. A mechanically equivalent package that contains a resistive heater in the die to evaluate thermal solutions.
TM	Thermal Monitor. A power reduction feature designed to decrease temperature after the processor has reached its maximum operating temperature.
V _{CC}	Processor core power supply
V _{DDQ}	DDR3L power supply.
VF	Vertex Fetch
VID	Voltage Identification
VS	Vertex Shader
VLD	Variable Length Decoding
VMM	Virtual Machine Monitor
VR	Voltage Regulator
V _{SS}	Processor ground
x1	Refers to a Link or Port with one Physical Lane
continued...	

Term	Description
x2	Refers to a Link or Port with two Physical Lanes
x4	Refers to a Link or Port with four Physical Lanes
x8	Refers to a Link or Port with eight Physical Lanes
x16	Refers to a Link or Port with sixteen Physical Lanes

2.0 Interfaces

2.1 System Memory Interface

- Two channels of DDR3L/DDR3L-RS memory with Unbuffered Small Outline Dual In-Line Memory Modules (SO-DIMM) with a maximum of two DIMMs per channel - Two DIMMs per channel is only supported in Quad Core package
- Single-channel and dual-channel memory organization modes
- Data burst length of eight for all memory organization modes
- DDR3L/DDR3L-RS I/O Voltage of 1.35V
- 64-bit wide channels
- Non-ECC, Unbuffered DDR3L/DDR3L-RS SO-DIMMs only
- Theoretical maximum memory bandwidth of:
 - 21.3 GB/s in dual-channel mode assuming DDR3L/DDR3L-RS 1333 MT/s
 - 25.6 GB/s in dual-channel mode assuming DDR3L/DDR3L-RS 1600 MT/s
 - 29.8 GB/s in dual-channel mode assuming DDR3L/DDR3L-RS 1866 MT/s

2.1.1 System Memory Technology Supported

The Integrated Memory Controller (IMC) supports DDR3L/DDR3L-RS protocols with two independent, 64-bit wide channels each accessing one or two DIMMs. The IMC supports one or two unbuffered non-ECC DDR3L/DDR3L-RS DIMM per channel; thus, allowing up to four device ranks per channel.

DDR3L/DDR3L-RS Data Transfer Rates:

- 1333 MT/s (PC3-10600)
- 1600 MT/s (PC3-12800)
- 1866 MT/s (PC3-14900)

DDR3L/DDR3L-RS SO-DIMM Modules:

- Raw Card B – Single Ranked x8 unbuffered non-ECC
- Raw Card F – Dual Ranked x8 (planar) unbuffered non-ECC

DRAM Device Technology:

- Standard 1Gb, 2Gb, and 4Gb technologies and addressing are supported for x8 devices. There is no support for memory modules with different technologies or capacities on opposite sides of the same memory module. If one side of a memory module is populated, the other side is either identical or empty.

**Table 3. Supported SO-DIMM Module Configurations**

Raw Card Version	DIMM Capacity	DRAM Organization	# of DRAM Devices	# of Row/Col Address Bits	# of Banks Inside DRAM	Page Size
B	1 GB	128 M x 8	8	14/10	8	8K
	2 GB	256 M x 8	8	15/10	8	8K
	4 GB	512 M x 8	8	16/10	8	8K
F	2 GB	128 M x 8	16	14/10	8	8K
	4 GB	256 M x 8	16	15/10	8	8K
	8 GB	512 M x 8	16	16/10	8	8K

Table 4. Supported Maximum Memory Size Per DIMM

Platform	Package	Memory DDR3L (note 1) DDR3L-RS (note 2)	Maximum Size per DIMM [GB]	Maximum Size Per Configuration [GB]			
				1 Ch 1 DPC	1 Ch 2 DPC (note 4)	2 Ch 1 DPC	2 Ch 2 DPC
Mobile H-Processor	BGA	SODIMM RC B (1Rx8) (note 3)	4	4	8	8	16
		SODIMM RC F (2Rx8) (note 3, 5)	8	8	16	16	32

Notes: 1. The maximum High Density memory capacity is achieved using 4 Gigabit memory technology devices (1 and 2 Gigabit devices are also supported).

2. DDR3L-RS is supported as a POR memory configuration as Intel expects these parts to be electrically and software identical to DDR3L. Actual validation checkout would depend on parts and vendor availability. PMO list for actual vendors and parts validated is available at <https://www-ssl.intel.com/content/www/us/en/platform-memory/platform-memory.html>.

3. Raw Cards x16 SO-DIMM modules are not supported.

4. 1 DPC on 4SODIMM Board (2 total memory DIMMs populated) is supported.

5. Memory Down using DDR3L 2Rx8 and 1Rx32 (DDP) configurations are supported using a white paper design guidance.

2.1.2 System Memory Timing Support

The IMC supports the following DDR3L/DDR3L-RS Speed Bin, CAS Write Latency (CWL), and command signal mode timings on the main memory interface:

- tCL = CAS Latency
- tRCD = Activate Command to READ or WRITE Command delay
- tRP = PRECHARGE Command Period
- CWL = CAS Write Latency
- Command Signal modes = 1N indicates a new command may be issued every clock and 2N indicates a new command may be issued every 2 clocks. Command launch mode programming depends on the transfer rate and memory configuration.

Table 5. DDR3L / DDR3L-RS System Memory Timing Support

Segment	Transfer Rate (MT/s)	tCL (tCK)	tRCD (tCK)	tRP (tCK)	CWL (tCK)	DPC	CMD Mode
Quad Core BGA Processor with GT3/GT2 Graphics (H-Processor)	1333	8/9	8/9	8/9	7	1	1N/2N
						2	2N
	1600	10/11	10/11	10/11	8	1	1N/2N
						2	2N
	1866	13	12/13	12/13	9	1	1N/2N
						2	2N

Note: System memory timing support is based on availability and is subject to change

2.1.3 System Memory Organization Modes

The Integrated Memory Controller (IMC) supports two memory organization modes – single-channel and dual-channel. Depending upon how the DIMM Modules are populated in each memory channel, a number of different configurations can exist.

Single-Channel Mode

In this mode, all memory cycles are directed to a single-channel. Single-channel mode is used when either Channel A or Channel B DIMM connectors are populated in any order, but not both.

Dual-Channel Mode – Intel® Flex Memory Technology Mode

The IMC supports Intel Flex Memory Technology Mode. Memory is divided into symmetric and asymmetric zones. The symmetric zone starts at the lowest address in each channel and is contiguous until the asymmetric zone begins or until the top address of the channel with the smaller capacity is reached. In this mode, the system runs with one zone of dual-channel mode and one zone of single-channel mode, simultaneously, across the whole memory array.

Note: Channels A and B can be mapped for physical channel 0 and 1 respectively or vice versa; however, channel A size must be greater or equal to channel B size.

Figure 2. Intel® Flex Memory Technology Operations

Dual-Channel Symmetric Mode

Dual-Channel Symmetric mode, also known as interleaved mode, provides maximum performance on real world applications. Addresses are ping-ponged between the channels after each cache line (64-byte boundary). If there are two requests, and the second request is to an address on the opposite channel from the first, that request can be sent before data from the first request has returned. If two consecutive cache lines are requested, both may be retrieved simultaneously, since they are ensured to be on opposite channels. Use Dual-Channel Symmetric mode when both Channel A and Channel B DIMM connectors are populated in any order, with the total amount of memory in each channel being the same.

When both channels are populated with the same memory capacity and the boundary between the dual channel zone and the single channel zone is the top of memory, the IMC operates completely in Dual-Channel Symmetric mode.

Note: The DRAM device technology and width may vary from one channel to the other.

2.1.4 System Memory Frequency

In all modes, the frequency of system memory is the lowest frequency of all memory modules placed in the system, as determined through the SPD registers on the memory modules. The system memory controller supports up to two DIMM connectors per channel. If DIMMs with different latency are populated across the channels, the BIOS will use the slower of the two latencies for both channels. For dual-channel mode both channels must have a DIMM connector populated. For single-channel mode, only a single channel can have a DIMM connector populated.

2.1.5 Intel® Fast Memory Access (Intel® FMA) Technology Enhancements

The following sections describe the Just-in-Time Scheduling, Command Overlap, and Out-of-Order Scheduling Intel FMA technology enhancements.

Just-in-Time Command Scheduling

The memory controller has an advanced command scheduler where all pending requests are examined simultaneously to determine the most efficient request to be issued next. The most efficient request is picked from all pending requests and issued to system memory Just-in-Time to make optimal use of Command Overlapping. Thus, instead of having all memory access requests go individually through an arbitration mechanism forcing requests to be executed one at a time, the requests can be started without interfering with the current request allowing for concurrent issuing of requests. This allows for optimized bandwidth and reduced latency while maintaining appropriate command spacing to meet system memory protocol.

Command Overlap

Command Overlap allows the insertion of the DRAM commands between the Activate, Pre-charge, and Read/Write commands normally used, as long as the inserted commands do not affect the currently executing command. Multiple commands can be issued in an overlapping manner, increasing the efficiency of system memory protocol.

Out-of-Order Scheduling

While leveraging the Just-in-Time Scheduling and Command Overlap enhancements, the IMC continuously monitors pending requests to system memory for the best use of bandwidth and reduction of latency. If there are multiple requests to the same open page, these requests would be launched in a back-to-back manner to make optimum use of the open memory page. This ability to reorder requests on the fly allows the IMC to further reduce latency and increase bandwidth efficiency.

2.1.6 Data Scrambling

The system memory controller incorporates a Data Scrambling feature to minimize the impact of excessive di/dt on the platform system memory VRs due to successive 1s and 0s on the data bus. Past experience has demonstrated that traffic on the data bus is not random and can have energy concentrated at specific spectral harmonics creating high di/dt , which is generally limited by data patterns that excite resonance between the package inductance and on die capacitances. As a result, the system memory controller uses a data scrambling feature to create pseudo-random patterns on the system memory data bus to reduce the impact of any excessive di/dt .

2.1.7 DRAM Clock Generation

Every supported DIMM has two differential clock pairs. There are a total of four clock pairs driven directly by the processor to two DIMMs.

2.1.8 DRAM Reference Voltage Generation

The memory controller has the capability of generating the DDR3L Reference Voltage (VREF) internally for both read (RDVREF) and write (VREFDQ) operations. The generated VREF can be changed in small steps, and an optimum VREF value is determined for both during a cold boot through advanced DDR3L/DDR3L-RS training procedures to provide the best voltage and signal margins.

2.2 PCI Express* Interface

This section describes the PCI Express* interface capabilities of the processor. See the *PCI Express Base Specification 3.0* for details on PCI Express*.

2.2.1 PCI Express* Support

The PCI Express* lanes (PEG[15:0] TX and RX) are fully-compliant to the *PCI Express Base Specification, Revision 3.0*.

The processor with the PCH support the configurations shown in the following table (**may vary depending on PCH SKUs**).

Table 6. PCI Express* Supported Configurations in Mobile Products

Configuration	Mobile
1x8, 2x4	GFX, I/O
2x8	GFX, I/O
1x16	GFX, I/O

- The port may negotiate down to narrower widths.
 - Support for x16/x8/x4/x2/x1 widths for a single PCI Express* mode.
- 2.5 GT/s, 5.0 GT/s and 8 GT/s PCI Express* bit rates are supported.
- Gen 1 Raw bit-rate on the data pins of 2.5 GT/s, resulting in a real bandwidth per pair of 250 MB/s given the 8b/10b encoding used to transmit data across this interface. This also does not account for packet overhead and link maintenance. Maximum theoretical bandwidth on the interface of 4 GB/s in each direction simultaneously, for an aggregate of 8 GB/s when x16 Gen 1.
- Gen 2 Raw bit-rate on the data pins of 5.0 GT/s, resulting in a real bandwidth per pair of 500 MB/s given the 8b/10b encoding used to transmit data across this interface. This also does not account for packet overhead and link maintenance. Maximum theoretical bandwidth on the interface of 8 GB/s in each direction simultaneously, for an aggregate of 16 GB/s when x16 Gen 2.
- Gen 3 raw bit-rate on the data pins of 8.0 GT/s, resulting in a real bandwidth per pair of 984 MB/s using 128b/130b encoding to transmit data across this interface. This also does not account for packet overhead and link maintenance. Maximum theoretical bandwidth on the interface of 16 GB/s in each direction simultaneously, for an aggregate of 32 GB/s when x16 Gen 3.
- Hierarchical PCI-compliant configuration mechanism for downstream devices.
- Traditional PCI style traffic (asynchronous snooped, PCI ordering).
- PCI Express* extended configuration space. The first 256 bytes of configuration space aliases directly to the PCI Compatibility configuration space. The remaining portion of the fixed 4-KB block of memory-mapped space above that (starting at 100h) is known as extended configuration space.
- PCI Express* Enhanced Access Mechanism. Accessing the device configuration space in a flat memory mapped fashion.
- Automatic discovery, negotiation, and training of link out of reset.
- Traditional AGP style traffic (asynchronous non-snooped, PCI-X* Relaxed ordering).

- Peer segment destination posted write traffic (no peer-to-peer read traffic) in Virtual Channel 0:
 - DMI -> PCI Express* Port 0
 - DMI -> PCI Express* Port 1
 - PCI Express* Port 0 -> DMI
 - PCI Express* Port 1 -> DMI
- 64-bit downstream address format, but the processor never generates an address above 64 GB (Bits 63:36 will always be zeros).
- 64-bit upstream address format, but the processor responds to upstream read transactions to addresses above 64 GB (addresses where any of Bits 63:36 are nonzero) with an Unsupported Request response. Upstream write transactions to addresses above 64 GB will be dropped.
- Re-issues Configuration cycles that have been previously completed with the Configuration Retry status.
- PCI Express* reference clock is 100-MHz differential clock.
- Power Management Event (PME) functions.
- Dynamic width capability.
- Message Signaled Interrupt (MSI and MSI-X) messages.
- Polarity inversion
- Dynamic lane numbering reversal as defined by the PCI Express Base Specification.
- Static lane numbering reversal. Does not support dynamic lane reversal, as defined (optional) by the *PCI Express Base Specification*.
- Supports Half Swing “low-power/low-voltage” mode.

Note: The processor does not support PCI Express* Hot-Plug.

2.2.2 PCI Express* Architecture

Compatibility with the PCI addressing model is maintained to ensure that all existing applications and drivers operate unchanged.

The PCI Express* configuration uses standard mechanisms as defined in the PCI Plug-and-Play specification. The processor PCI Express* ports support Gen 3. At 8 GT/s, Gen 3 operation results in twice as much bandwidth per lane as compared to Gen 2 operation. The 16 lanes PEG can operate at 2.5 GT/s, 5 GT/s, or 8 GT/s.

Gen 3 PCI Express* uses a 128b/130b encoding that is about 23% more efficient than the 8b/10b encoding used in Gen 1 and Gen 2.

The PCI Express* architecture is specified in three layers – Transaction Layer, Data Link Layer, and Physical Layer. See the *PCI Express Base Specification 3.0* for details of PCI Express* architecture.

2.2.3 PCI Express* Configuration Mechanism

The PCI Express* (external graphics) link is mapped through a PCI-to-PCI bridge structure.

Figure 3. PCI Express* Related Register Structures in the Processor

PCI Express* extends the configuration space to 4096 bytes per-device/function, as compared to 256 bytes allowed by the conventional PCI specification. PCI Express* configuration space is divided into a PCI-compatible region (that consists of the first 256 bytes of a logical device's configuration space) and an extended PCI Express* region (that consists of the remaining configuration space). The PCI-compatible region can be accessed using either the mechanisms defined in the PCI specification or using the enhanced PCI Express* configuration access mechanism described in the PCI Express* Enhanced Configuration Mechanism section.

The PCI Express* Host Bridge is required to translate the memory-mapped PCI Express* configuration space accesses from the host processor to PCI Express* configuration cycles. To maintain compatibility with PCI configuration addressing mechanisms, it is recommended that system software access the enhanced configuration space using 32-bit operations (32-bit aligned) only. See the *PCI Express Base Specification* for details of both the PCI-compatible and PCI Express* Enhanced configuration mechanisms and transaction rules.

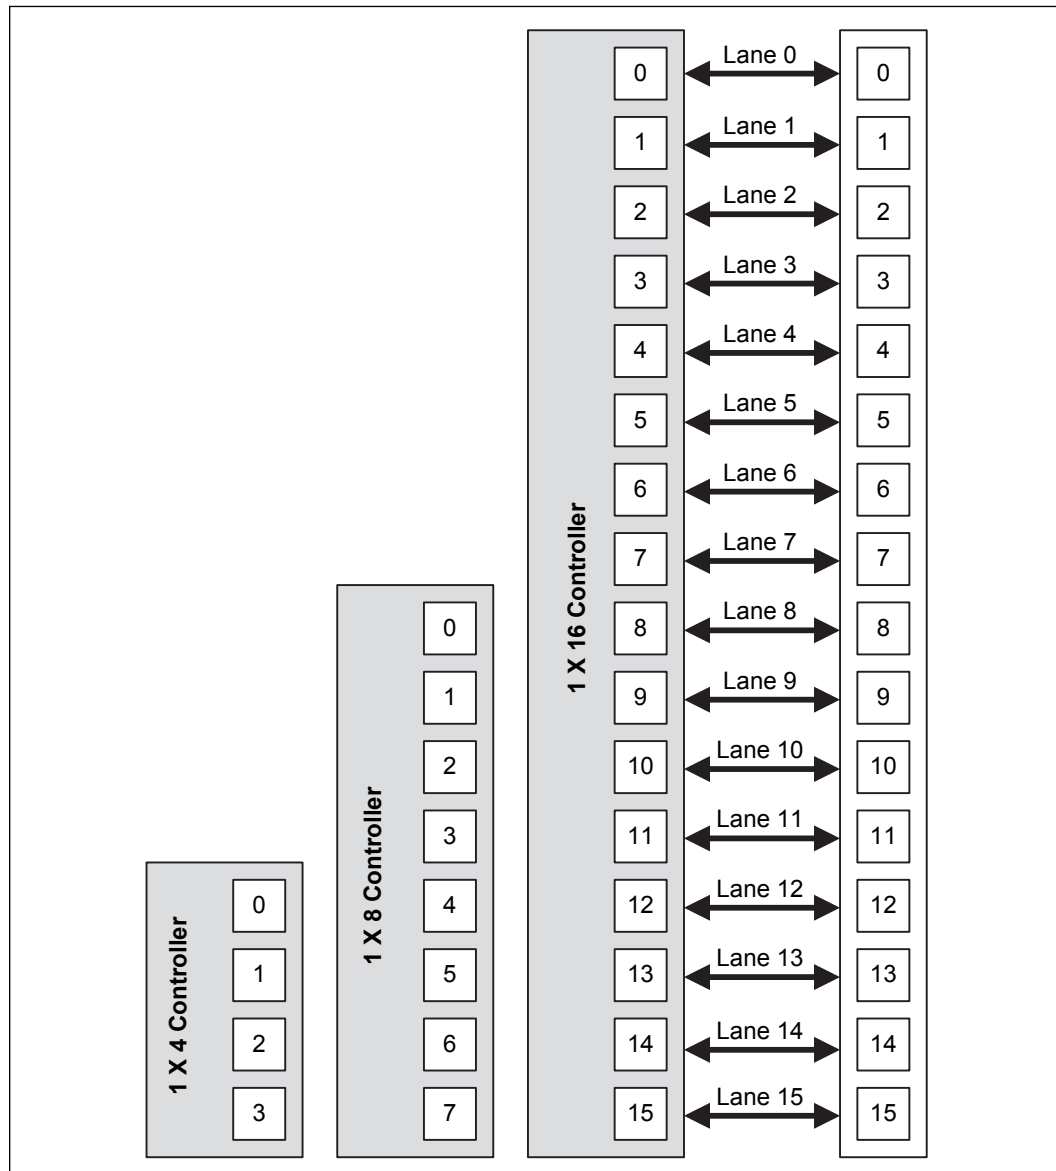

PCI Express* Graphics

The external graphics attach (PEG) on the processor is a single, 16-lane (x16) port. The PEG port is designed to be compliant with the *PCI Express Base Specification*, Revision 3.0.

PCI Express* Lanes Connection

The following figure demonstrates the PCIe* lane mapping.

Figure 4. PCI Express* Typical Operation 16 Lanes Mapping

2.3 Direct Media Interface (DMI)

Direct Media Interface (DMI) connects the processor and the PCH. Next generation DMI2 is supported.

Note: Only DMI x4 configuration is supported.

- DMI 2.0 support.
- Compliant to Direct Media Interface Second Generation (DMI2).
- Four lanes in each direction.

- 5 GT/s point-to-point DMI interface to PCH is supported.
- Raw bit-rate on the data pins of 5.0 GB/s, resulting in a real bandwidth per pair of 500 MB/s given the 8b/10b encoding used to transmit data across this interface. Does not account for packet overhead and link maintenance.
- Maximum theoretical bandwidth on interface of 2 GB/s in each direction simultaneously, for an aggregate of 4 GB/s when DMI x4.
- Shares 100-MHz PCI Express* reference clock.
- 64-bit downstream address format, but the processor never generates an address above 64 GB (Bits 63:36 will always be zeros).
- 64-bit upstream address format, but the processor responds to upstream read transactions to addresses above 64 GB (addresses where any of Bits 63:36 are nonzero) with an Unsupported Request response. Upstream write transactions to addresses above 64 GB will be dropped.
- Supports the following traffic types to or from the PCH:
 - DMI -> DRAM
 - DMI -> processor core (Virtual Legacy Wires (VLWs), Resetwarn, or MSIs only)
 - Processor core -> DMI
- APIC and MSI interrupt messaging support:
 - Message Signaled Interrupt (MSI and MSI-X) messages
- Downstream SMI, SCI and SERR error indication.
- Legacy support for ISA regime protocol (PHOLD/PHOLDA) required for parallel port DMA, floppy drive, and LPC bus masters.
- DC coupling – no capacitors between the processor and the PCH.
- Polarity inversion.
- PCH end-to-end lane reversal across the link.
- Supports Half Swing “low-power/low-voltage”.

DMI Error Flow

DMI can only generate SERR in response to errors, never SCI, SMI, MSI, PCI INT, or GPE. Any DMI related SERR activity is associated with Device 0.

DMI Link Down

The DMI link going down is a fatal, unrecoverable error. If the DMI data link goes to data link down, after the link was up, then the DMI link hangs the system by not allowing the link to retrain to prevent data corruption. This link behavior is controlled by the PCH.

Downstream transactions that had been successfully transmitted across the link prior to the link going down may be processed as normal. No completions from downstream, non-posted transactions are returned upstream over the DMI link after a link down event.

2.4 Processor Graphics

The processor graphics contains a generation 8 graphics core architecture. This enables substantial gains in performance and lower power consumption over previous generations.

- Next Generation Intel Clear Video Technology HD Support is a collection of video playback and enhancement features that improve the end user's viewing experience
 - Encode / transcode HD content
 - Playback of high definition content including Blu-ray Disc*
 - Superior image quality with sharper, more colorful images
 - Playback of Blu-ray* disc S3D content using HDMI (1.4a specification compliant with 3D)
- DirectX* Video Acceleration (DXVA) support for accelerating video processing
 - Full AVC/VC1/MPEG2 HW Decode
- Advanced Scheduler 2.0, 1.0, XPDM support
- Windows* 8, Windows* 7, OSX, Linux* operating system support
- DirectX* 11.1, DirectX* 11, DirectX* 10.1, DirectX* 10, DirectX* 9 support.
- OpenGL* 4.0, support
- Switchable Graphics muxless support for mobile platforms

2.5 Processor Graphics Controller (GT)

The Graphics Engine Architecture includes 3D compute elements, Multi-format HW assisted decode/encode pipeline, and Mid-Level Cache (MLC) for superior high definition playback, video quality, and improved 3D performance and media.

The Display Engine handles delivering the pixels to the screen. GSA (Graphics in System Agent) is the primary channel interface for display memory accesses and "PCI-like" traffic in and out.

Figure 5. Processor Graphics Controller Unit Block Diagram

2.5.1 3D and Video Engines for Graphics Processing

The 3D engine provides the following performance and power-management enhancements.

3D Pipeline

The 3D graphics pipeline architecture simultaneously operates on different primitives or on different portions of the same primitive. All the cores are fully programmable, increasing the versatility of the 3D Engine.

3D Engine Execution Units

- The EUs perform 128-bit wide execution per clock.
- Support SIMD8 instructions for vertex processing and SIMD16 instructions for pixel processing.

Vertex Fetch (VF) Stage

The VF stage executes 3DPRIMITIVE commands. Some enhancements have been included to better support legacy D3D APIs as well as SGI OpenGL*.

Vertex Shader (VS) Stage

The VS stage performs shading of vertices output by the VF function. The VS unit produces an output vertex reference for every input vertex reference received from the VF unit, in the order received.

Geometry Shader (GS) Stage

The GS stage receives inputs from the VS stage. Compiled application-provided GS programs, specifying an algorithm to convert the vertices of an input object into some output primitives. For example, a GS shader may convert lines of a line strip into polygons representing a corresponding segment of a blade of grass centered on the line. Or it could use adjacency information to detect silhouette edges of triangles and output polygons extruding out from the edges.

Clip Stage

The Clip stage performs general processing on incoming 3D objects. However, it also includes specialized logic to perform a Clip Test function on incoming objects. The Clip Test optimizes generalized 3D Clipping. The Clip unit examines the position of incoming vertices, and accepts/rejects 3D objects based on its Clip algorithm.

Strips and Fans (SF) Stage

The SF stage performs setup operations required to rasterize 3D objects. The outputs from the SF stage to the Windower stage contain implementation-specific information required for the rasterization of objects and also supports clipping of primitives to some extent.

Windower / IZ (WIZ) Stage

The WIZ unit performs an early depth test, which removes failing pixels and eliminates unnecessary processing overhead.

The Windower uses the parameters provided by the SF unit in the object-specific rasterization algorithms. The WIZ unit rasterizes objects into the corresponding set of pixels. The Windower is also capable of performing dithering, whereby the illusion of a higher resolution when using low-bpp channels in color buffers is possible. Color dithering diffuses the sharp color bands seen on smooth-shaded objects.

Video Engine

The Video Engine handles the non-3D (media/video) applications. It includes support for VLD and MPEG2 decode in hardware.

2D Engine

The 2D Engine contains BLT (Block Level Transfer) functionality and an extensive set of 2D instructions. To take advantage of the 3D during engine's functionality, some BLT functions make use of the 3D renderer.

Processor Graphics VGA Registers

The 2D registers consists of original VGA registers and others to support graphics modes that have color depths, resolutions, and hardware acceleration features that go beyond the original VGA standard.

Logical 128-Bit Fixed BLT and 256 Fill Engine

This BLT engine accelerates the GUI of Microsoft Windows* operating systems. The 128-bit BLT engine provides hardware acceleration of block transfers of pixel data for many common Windows operations. The BLT engine can be used for the following:

- Move rectangular blocks of data between memory locations
- Data alignment
- To perform logical operations (raster ops)

The rectangular block of data does not change, as it is transferred between memory locations. The allowable memory transfers are between: cacheable system memory and frame buffer memory, frame buffer memory and frame buffer memory, and within system memory. Data to be transferred can consist of regions of memory, patterns, or solid color fills. A pattern is always 8 x 8 pixels wide and may be 8, 16, or 32 bits per pixel.

The BLT engine expands monochrome data into a color depth of 8, 16, or 32 bits. BLTs can be either opaque or transparent. Opaque transfers move the data specified to the destination. Transparent transfers compare destination color to source color and write according to the mode of transparency selected.

Data is horizontally and vertically aligned at the destination. If the destination for the BLT overlaps with the source memory location, the BLT engine specifies which area in memory to begin the BLT transfer. Hardware is included for all 256 raster operations (source, pattern, and destination) defined by Microsoft*, including transparent BLT.

The BLT engine has instructions to invoke BLT and stretch BLT operations, permitting software to set up instruction buffers and use batch processing. The BLT engine can perform hardware clipping during BLTs.

2.5.2 Multi Graphics Controllers Multi-Monitor Support

The processor supports simultaneous use of the Processor Graphics Controller (GT) and a x16 PCI Express* Graphics (PEG) device. The processor supports a maximum of 2 displays connected to the PEG card in parallel with up to 2 displays connected to the processor and PCH.

Note: When supporting Multi Graphics Multi Monitors, "drag and drop" between monitors and the 2x8PEG is not supported.

2.6 Digital Display Interface (DDI)

- The processor supports:
 - Three Digital Display (x4 DDI) interfaces that can be configured as DisplayPort*, HDMI*, or DVI. DisplayPort* can be configured to use 1, 2, or 4 lanes depending on the bandwidth requirements and link data rate of RBR (1.62 GT/s), HBR (2.7 GT/s) and HBR2 (5.4 GT/s). When configured as HDMI*, DDIx4 port can support 2.97 GT/s. Built-in displays are only supported on eDP.
 - In addition, the processor supports a dedicated embedded DisplayPort* (eDPx4) interface. eDPx4 can be configured in one of the following ways:
 1. One x2 embedded DisplayPort* and one x2 FDI (FDI Port for legacy VGA support on PCH).

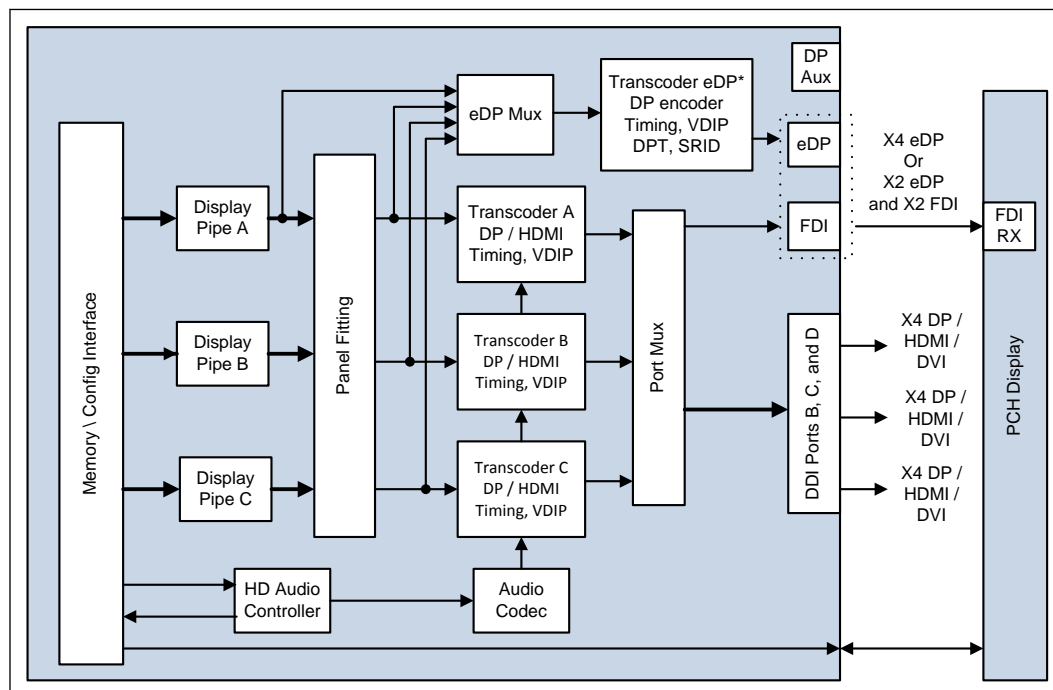

- FDI_TXN0 and FDI_TXP0 should be routed to EDP_TXN2 and EDP_TXP2, respectively
- FDI_TXN1 and FDI_TXP1 should be routed to EDP_TXN3 and EDP_TXP3, respectively

2. One x4 embedded DisplayPort* and no FDI (no VGA support from PCH in this configuration)

Note: One of the two configurations of eDP can be selected using VBIOS Tool (VBT) and hardware gets programmed to function as x4 eDP or x2 eDP and x2 FDI by VBIOS during boot time.

- The HDMI* interface supports HDMI with 3D, 4K, Deep Color, and x.v.Color. The DisplayPort* interface supports the VESA DisplayPort* Standard Version 1, Revision 2.
- The processor supports High-bandwidth Digital Content Protection (HDCP) for high-definition content playback over digital interfaces.
- The processor also integrates dedicated a Mini HD audio controller to drive audio on integrated digital display interfaces, such as HDMI* and DisplayPort*. The HD audio controller on the PCH would continue to support down CODECs, and so on. The processor Mini HD audio controller supports two High-Definition Audio streams simultaneously on any of the three digital ports.
- The processor supports streaming any 3 independent and simultaneous display combination of DisplayPort*/HDMI*/DVI/eDP*/VGA monitors with the exception of 3 simultaneous display support of HDMI*/DVI . In the case of 3 simultaneous displays, two High Definition Audio streams over the digital display interfaces are supported.
- Each digital port is capable of driving resolutions up to 3840x2160 at 60 Hz through DisplayPort* and 4096x2304 at 24 Hz/2560x1600 at 60 Hz using HDMI*.
- DisplayPort* Aux CH, DDC channel, Panel power sequencing, and HPD are supported through the PCH.

Figure 6. Processor Display Architecture

Display is the presentation stage of graphics. This involves:

- Pulling rendered data from memory
- Converting raw data into pixels
- Blending surfaces into a frame
- Organizing pixels into frames
- Optionally scaling the image to the desired size
- Re-timing data for the intended target
- Formatting data according to the port output standard

DisplayPort*

DisplayPort* is a digital communication interface that uses differential signaling to achieve a high-bandwidth bus interface designed to support connections between PCs and monitors, projectors, and TV displays. DisplayPort* is also suitable for display connections between consumer electronics devices, such as high-definition optical disc players, set top boxes, and TV displays.

A DisplayPort* consists of a Main Link, Auxiliary channel, and a Hot-Plug Detect signal. The Main Link is a unidirectional, high-bandwidth, and low latency channel used for transport of isochronous data streams such as uncompressed video and audio. The Auxiliary Channel (AUX CH) is a half-duplex bidirectional channel used for link management and device control. The Hot-Plug Detect (HPD) signal serves as an interrupt request for the sink device.

The processor is designed in accordance with the VESA DisplayPort* Standard Version 1.2a. The processor supports *VESA DisplayPort* PHY Compliance Test Specification 1.2a* and *VESA DisplayPort* Link Layer Compliance Test Specification 1.2a*.

Figure 7. DisplayPort* Overview

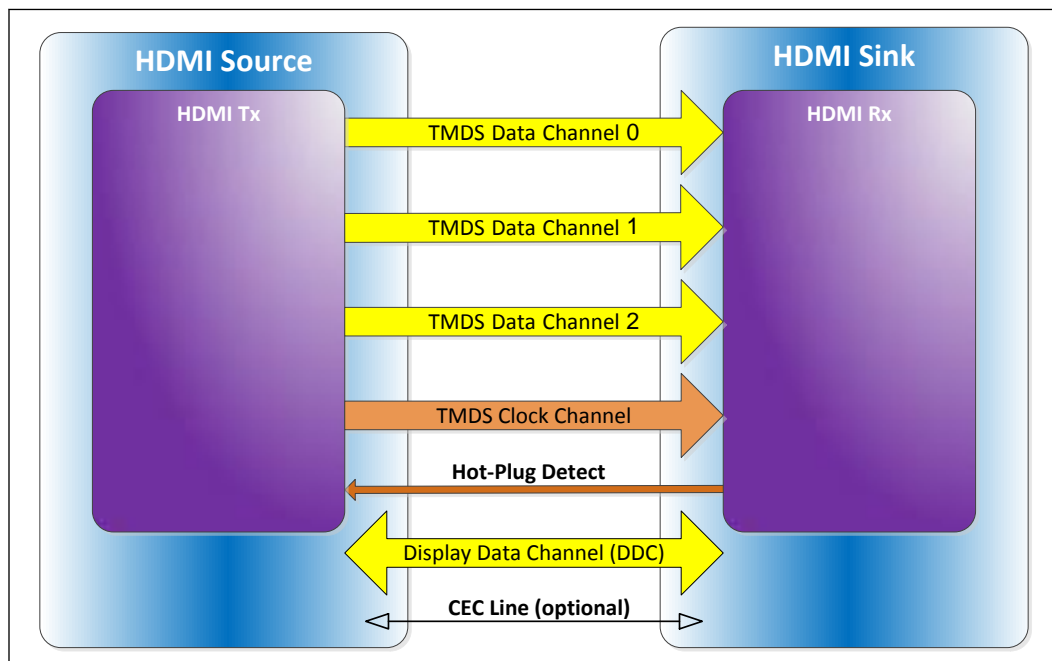

High-Definition Multimedia Interface (HDMI*)

The High-Definition Multimedia Interface* (HDMI*) is provided for transmitting uncompressed digital audio and video signals from DVD players, set-top boxes, and other audiovisual sources to television sets, projectors, and other video displays. It can carry high quality multi-channel audio data and all standard and high-definition consumer electronics video formats. The HDMI display interface connecting the processor and display devices uses transition minimized differential signaling (TMDS) to carry audiovisual information through the same HDMI cable.

HDMI includes three separate communications channels — TMDS, DDC, and the optional CEC (consumer electronics control). CEC is not supported on the processor. As shown in the following figure, the HDMI cable carries four differential pairs that make up the TMDS data and clock channels. These channels are used to carry video, audio, and auxiliary data. In addition, HDMI carries a VESA DDC. The DDC is used by an HDMI Source to determine the capabilities and characteristics of the Sink.

Audio, video, and auxiliary (control/status) data is transmitted across the three TMDS data channels. The video pixel clock is transmitted on the TMDS clock channel and is used by the receiver for data recovery on the three data channels. The digital display data signals driven natively through the PCH are AC coupled and needs level shifting to convert the AC coupled signals to the HDMI compliant digital signals.

The processor HDMI interface is designed in accordance with the High-Definition Multimedia Interface with 3D, 4K, Deep Color, and x.v.Color.

Figure 8. HDMI* Overview

Digital Video Interface

The processor Digital Ports can be configured to drive DVI-D. DVI uses TMDs for transmitting data from the transmitter to the receiver, which is similar to the HDMI protocol except for the audio and CEC. Refer to the HDMI section for more information on the signals and data transmission. To drive DVI-I through the back panel the VGA DDC signals are connected along with the digital data and clock signals from one of the Digital Ports. When a system has support for a DVI-I port, then either VGA or the DVI-D through a single DVI-I connector can be driven, but not both simultaneously.

The digital display data signals driven natively through the processor are AC coupled and need level shifting to convert the AC coupled signals to the HDMI compliant digital signals.

embedded DisplayPort*

embedded DisplayPort* (eDP*) is an embedded version of the DisplayPort standard oriented towards applications such as notebook and All-In-One PCs. The processor supports dedicated eDP. Like DisplayPort, embedded DisplayPort also consists of a Main Link, Auxiliary channel, and an optional Hot-Plug Detect signal.

The eDP on the processor can be configured for 2 lanes using a dedicated eDPx2 port on the processor or 4 lanes by configuring the Intel FDI port as eDPx2 in addition to dedicated eDPx2 port on processor.

Processor supports embedded DisplayPort* (eDP*) Standard Version 1.3 and VESA embedded DisplayPort* Standard Version 1.3.

Integrated Audio

- HDMI and display port interfaces carry audio along with video.

- Processor supports two DMA controllers to output two High Definition audio streams on two digital ports simultaneously.
- Supports only the internal HDMI and DP CODECs.

Table 7. Processor Supported Audio Formats over HDMI*and DisplayPort*

Audio Formats	HDMI*	DisplayPort*
AC-3 Dolby* Digital	Yes	Yes
Dolby Digital Plus	Yes	Yes
DTS-HD*	Yes	Yes
LPCM, 192 kHz/24 bit, 8 Channel	Yes	Yes
Dolby TrueHD, DTS-HD Master Audio* (Lossless Blu-Ray Disc* Audio Format)	Yes	Yes

The processor will continue to support Silent stream. Silent stream is an integrated audio feature that enables short audio streams, such as system events to be heard over the HDMI and DisplayPort monitors. The processor supports silent streams over the HDMI and DisplayPort interfaces at 44.1 kHz, 48 kHz, 88.2 kHz, 96 kHz, 176.4 kHz, and 192 kHz sampling rates.

Multiple Display Configurations

The following multiple display configuration modes are supported (with appropriate driver software):

- Single Display is a mode with one display port activated to display the output to one display device.
- Intel Display Clone is a mode with up to three display ports activated to drive the display content of same color depth setting but potentially different refresh rate and resolution settings to all the active display devices connected.
- Extended Desktop is a mode with up to three display ports activated to drive the content with potentially different color depth, refresh rate, and resolution settings on each of the active display devices connected.

The digital ports on the processor can be configured to support DisplayPort*/HDMI/DVI. The following table shows examples of valid three display configurations through the processor.

Table 8. Valid Three Display Configurations through the Processor

Display 1	Display 2	Display 3	Maximum Resolution Display 1	Maximum Resolution Display 2	Maximum Resolution Display 3
HDMI	HDMI	DP	4096x2304 @ 24 Hz 2560x1600 @ 60 Hz		3840x2160 @ 60 Hz
DVI	DVI	DP	1920x1200 @ 60 Hz		3840x2160 @ 60 Hz
DP	DP	DP	3840x2160 @ 60 Hz		
VGA	DP	HDMI	1920x1200 @ 60 Hz	3840x2160 @ 60 Hz	4096x2304 @ 24 Hz 2560x1600 @ 60 Hz
<i>continued...</i>					

Display 1	Display 2	Display 3	Maximum Resolution Display 1	Maximum Resolution Display 2	Maximum Resolution Display 3
eDP	DP	HDMI	3840x2160 @ 60 Hz	3840x2160 @ 60 Hz	4096x2304 @ 24 Hz 2560x1600 @ 60 Hz
eDP	DP	DP	3840x2160 @ 60 Hz	3840x2160 @ 60 Hz	
eDP	HDMI	HDMI	3840x2160 @ 60 Hz	4096x2304 @ 24 Hz 2560x1600 @ 60 Hz	
Notes: 1. Requires support of 2 channel DDR3L/DDR3L-RS 1600 MT/s configuration for driving 3 simultaneous 3840x2160 @ 60 Hz display resolutions 2. DP and eDP resolutions in the above table are supported for 4 lanes with link data rate HBR2.					

The following table shows the DP/eDP resolutions supported for 1, 2, or 4 lanes depending on link data rate of RBR, HBR, and HBR2.

Table 9. DisplayPort and embedded DisplayPort* Resolutions for 1, 2, 4 Lanes – Link Data Rate of RBR, HBR, and HBR2

Link Data Rate	Lane Count		
	1	2	4
RBR	1064x600	1400x1050	2240x1400
HBR	1280x960	1920x1200	2880x1800
HBR2	1920x1200	2880x1800	3840x2160

Any 3 displays can be supported simultaneously using the following rules:

- Maximum of 2 HDMI
- Maximum of 2 DVI
- Maximum of 1 HDMI and 1 DVI
- Any 3 DisplayPort
- One VGA
- One eDP

High-bandwidth Digital Content Protection (HDCP)

HDCP is the technology for protecting high-definition content against unauthorized copy or unreceptive between a source (computer, digital set top boxes, and so on) and the sink (panels, monitor, and TVs). The processor supports HDCP 1.4 for content protection over wired displays (HDMI*, DVI, and DisplayPort*).

The HDCP 1.4 keys are integrated into the processor and customers are not required to physically configure or handle the keys.

2.7 Intel® Flexible Display Interface (Intel® FDI)

- The Intel Flexible Display Interface (Intel FDI) passes display data from the processor (source) to the PCH (sink) for display through a display interface on the PCH.

- Intel FDI supports 2 lanes at 2.7 GT/s fixed frequency. This can be configured to 1 or 2 lanes depending on the bandwidth requirements.
- Intel FDI supports 8 bits per color only.
- Side band sync pin (FDI_CSYNC).
- Side band interrupt pin (DISP_INT). This carries combined interrupt for HPDs of all the ports, AUX and I²C completion events, and so on.
- Intel FDI is not encrypted as it drives only VGA and content protection is not supported on VGA.

2.8 Platform Environmental Control Interface (PECI)

PECI is an Intel proprietary interface that provides a communication channel between Intel processors and external components, like Super I/O (SIO) and Embedded Controllers (EC), to provide processor temperature, Turbo, Configurable TDP, and memory throttling control mechanisms and many other services. PECI is used for platform thermal management and real time control and configuration of processor features and performance.

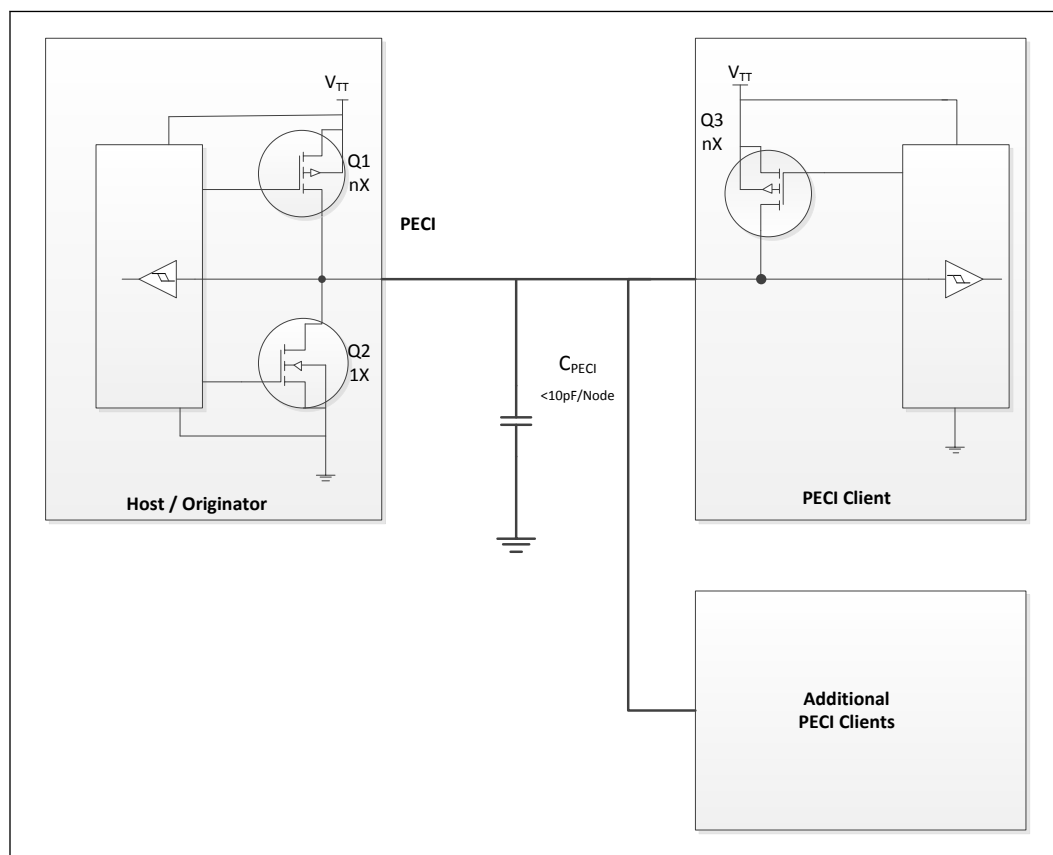

2.8.1 PECI Bus Architecture

The PECI architecture is based on a wired-OR bus that the clients (as processor PECI) can pull up high (with strong drive).

The idle state on the bus is near zero.

The following figure demonstrates PECI design and connectivity. While the host/originator can be a third party PECI host, one of the PECI clients is a processor PECI device.

Figure 9. PECl Host-Clients Connection Example

3.0 Technologies

This chapter provides a high-level description of Intel technologies implemented in the processor.

The implementation of the features may vary between the processor SKUs.

Details on the different technologies of Intel processors and other relevant external notes are located at the Intel technology web site: <http://www.intel.com/technology/>

3.1 Intel® Virtualization Technology (Intel® VT)

Intel® Virtualization Technology (Intel® VT) makes a single system appear as multiple independent systems to software. This allows multiple, independent operating systems to run simultaneously on a single system. Intel VT comprises technology components to support virtualization of platforms based on Intel architecture microprocessors and chipsets.

Intel® Virtualization Technology (Intel® VT) for IA-32, Intel® 64 and Intel® Architecture (Intel® VT-x) added hardware support in the processor to improve the virtualization performance and robustness. Intel® Virtualization Technology for Directed I/O (Intel VT-d) extends Intel® VT-x by adding hardware assisted support to improve I/O device virtualization performance.

Intel® VT-x specifications and functional descriptions are included in the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3B* and is available at:

<http://www.intel.com/products/processor/manuals/index.htm>

The Intel VT-d specification and other Intel VT documents can be referenced at:

<http://www.intel.com/technology/virtualization/index.htm>

<https://sharedspaces.intel.com/sites/PCDC/SitePages/Ingredients/ingredient.aspx?ing=VT>

Intel® VT-x Objectives

Intel VT-x provides hardware acceleration for virtualization of IA platforms. Virtual Machine Monitor (VMM) can use Intel VT-x features to provide an improved reliable virtualized platform. By using Intel VT-x, a VMM is:

- **Robust:** VMMs no longer need to use paravirtualization or binary translation. This means that off-the-shelf operating systems and applications can be run without any special steps.
- **Enhanced:** Intel VT enables VMMs to run 64-bit guest operating systems on IA x86 processors.

- **More reliable:** Due to the hardware support, VMMs can now be smaller, less complex, and more efficient. This improves reliability and availability and reduces the potential for software conflicts.
- **More secure:** The use of hardware transitions in the VMM strengthens the isolation of VMs and further prevents corruption of one VM from affecting others on the same system.

Intel® VT-x Features

The processor supports the following Intel VT-x features:

- Extended Page Table (EPT) Accessed and Dirty Bits
 - EPT A/D bits enabled VMMs to efficiently implement memory management and page classification algorithms to optimize VM memory operations, such as de-fragmentation, paging, live migration, and check-pointing. Without hardware support for EPT A/D bits, VMMs may need to emulate A/D bits by marking EPT paging-structures as not-present or read-only, and incur the overhead of EPT page-fault VM exits and associated software processing.
- Extended Page Table Pointer (EPTP) switching
 - EPTP switching is a specific VM function. EPTP switching allows guest software (in VMX non-root operation, supported by EPT) to request a different EPT paging-structure hierarchy. This is a feature by which software in VMX non-root operation can request a change of EPTP without a VM exit. Software can choose among a set of potential EPTP values determined in advance by software in VMX root operation.
- Pause loop exiting
 - Support VMM schedulers seeking to determine when a virtual processor of a multiprocessor virtual machine is not performing useful work. This situation may occur when not all virtual processors of the virtual machine are currently scheduled and when the virtual processor in question is in a loop involving the PAUSE instruction. The new feature allows detection of such loops and is thus called PAUSE-loop exiting.

The processor core supports the following Intel VT-x features:

- Extended Page Tables (EPT)
 - EPT is hardware assisted page table virtualization.
 - It eliminates VM exits from the guest operating system to the VMM for shadow page-table maintenance.
- Virtual Processor IDs (VPID)
 - Ability to assign a VM ID to tag processor core hardware structures (such as TLBs).
 - This avoids flushes on VM transitions to give a lower-cost VM transition time and an overall reduction in virtualization overhead.
- Guest Preemption Timer
 - Mechanism for a VMM to preempt the execution of a guest operating system after an amount of time specified by the VMM. The VMM sets a timer value before entering a guest.
 - The feature aids VMM developers in flexibility and Quality of Service (QoS) guarantees.

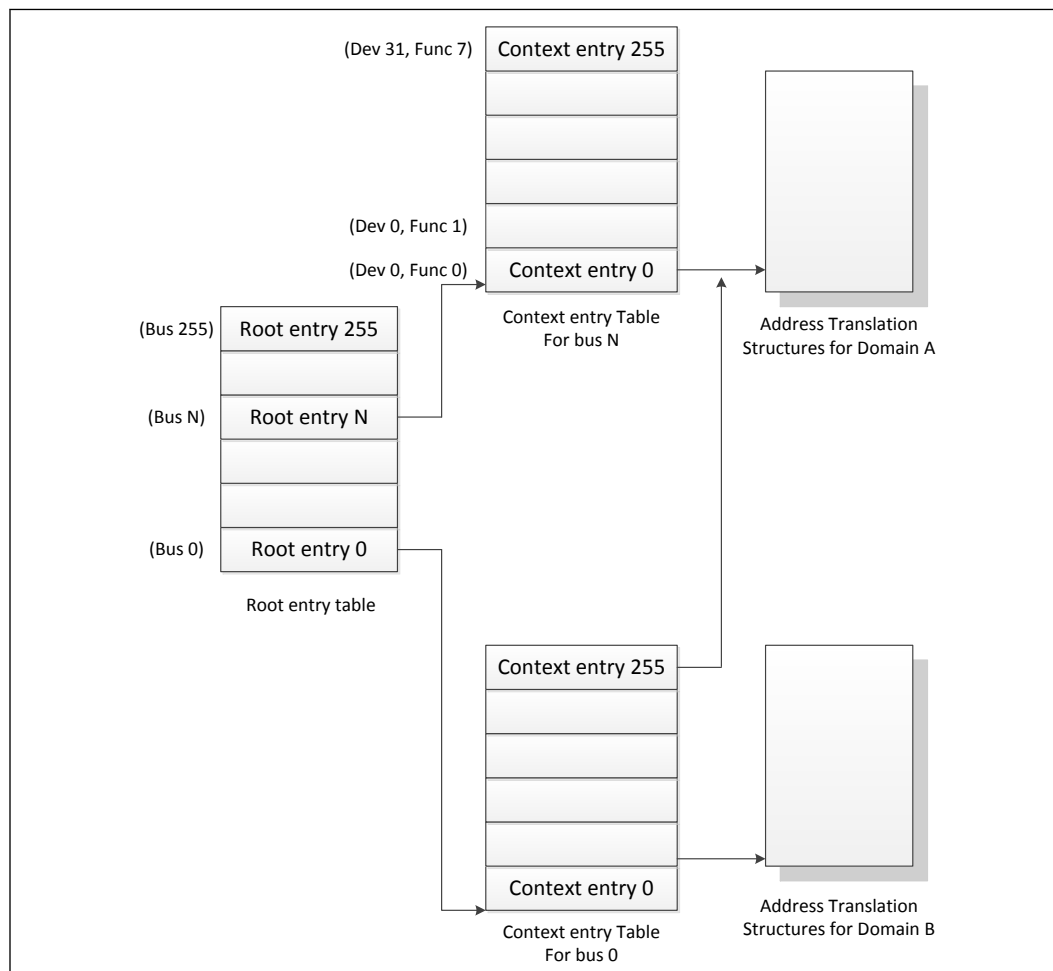

- Descriptor-Table Exiting
 - Descriptor-table exiting allows a VMM to protect a guest operating system from an internal (malicious software based) attack by preventing relocation of key system data structures like IDT (interrupt descriptor table), GDT (global descriptor table), LDT (local descriptor table), and TSS (task segment selector).
 - A VMM using this feature can intercept (by a VM exit) attempts to relocate these data structures and prevent them from being tampered by malicious software.

Intel® VT-d Objectives

The key Intel VT-d objectives are domain-based isolation and hardware-based virtualization. A domain can be abstractly defined as an isolated environment in a platform to which a subset of host physical memory is allocated. Intel VT-d provides accelerated I/O performance for a virtualized platform and provides software with the following capabilities:

- I/O device assignment and security: for flexibly assigning I/O devices to VMs and extending the protection and isolation properties of VMs for I/O operations.
- DMA remapping: for supporting independent address translations for Direct Memory Accesses (DMA) from devices.
- Interrupt remapping: for supporting isolation and routing of interrupts from devices and external interrupt controllers to appropriate VMs.
- Reliability: for recording and reporting to system software DMA and interrupt errors that may otherwise corrupt memory or impact VM isolation.

Intel VT-d accomplishes address translation by associating a transaction from a given I/O device to a translation table associated with the Guest to which the device is assigned. It does this by means of the data structure in the following illustration. This table creates an association between the device's PCI Express* Bus/Device/Function (B/D/F) number and the base address of a translation table. This data structure is populated by a VMM to map devices to translation tables in accordance with the device assignment restrictions above, and to include a multi-level translation table (VT-d Table) that contains Guest specific address translations.

Figure 10. Device to Domain Mapping Structures

Intel VT-d functionality, often referred to as an Intel VT-d Engine, has typically been implemented at or near a PCI Express host bridge component of a computer system. This might be in a chipset component or in the PCI Express functionality of a processor with integrated I/O. When one such Intel VT-d engine receives a PCI Express transaction from a PCI Express bus, it uses the B/D/F number associated with the transaction to search for an Intel VT-d translation table. In doing so, it uses the B/D/F number to traverse the data structure shown in the above figure. If it finds a valid Intel VT-d table in this data structure, it uses that table to translate the address provided on the PCI Express bus. If it does not find a valid translation table for a given translation, this results in an Intel VT-d fault. If Intel VT-d translation is required, the Intel VT-d engine performs an N-level table walk.

For more information, refer to *Intel® Virtualization Technology for Directed I/O Architecture Specification* [http://download.intel.com/technology/computing/vptech/Intel\(r\)_VT_for_Direct_IO.pdf](http://download.intel.com/technology/computing/vptech/Intel(r)_VT_for_Direct_IO.pdf)

Intel® VT-d Features

The processor supports the following Intel VT-d features:

- Memory controller and processor graphics comply with the Intel VT-d 1.2 Specification
- Two Intel VT-d DMA remap engines
 - iGFX DMA remap engine
 - Default DMA remap engine (covers all devices except iGFX)
- Support for root entry, context entry, and default context
- 39-bit guest physical address and host physical address widths
- Support for 4 KB page sizes
- Support for register-based fault recording only (for single entry only) and support for MSI interrupts for faults
- Support for both leaf and non-leaf caching
- Support for boot protection of default page table
- Support for non-caching of invalid page table entries
- Support for hardware-based flushing of translated but pending writes and pending reads, on IOTLB invalidation
- Support for Global, Domain specific, and Page specific IOTLB invalidation
- MSI cycles (MemWr to address FEEEx_xxxxh) not translated
 - Translation faults result in cycle forwarding to VBIOS region (byte enables masked for writes). Returned data may be bogus for internal agents; PEG/DMI interfaces return unsupported request status
- Interrupt remapping is supported
- Queued invalidation is supported
- Intel VT-d translation bypass address range is supported (Pass Through)

The processor supports the following added new Intel VT-d features:

- 4-level Intel VT-d Page walk: Both default Intel VT-d engine, as well as the IGD Intel VT-d engine, are upgraded to support 4-level Intel VT-d tables (adjusted guest address width 48 bits)
 - Intel VT-d superpage: support of Intel VT-d superpage (2 MB, 1 GB) for the default Intel VT-d engine (that covers all devices except IGD)
- IGD Intel VT-d engine does not support superpage and BIOS should disable superpage in default Intel VT-d engine when iGFX is enabled.

Note: Intel VT-d Technology may not be available on all SKUs.

3.2 Intel® Trusted Execution Technology (Intel® TXT)

Intel Trusted Execution Technology (Intel TXT) defines platform-level enhancements that provide the building blocks for creating trusted platforms.

The Intel TXT platform helps to provide the authenticity of the controlling environment such that those wishing to rely on the platform can make an appropriate trust decision. The Intel TXT platform determines the identity of the controlling environment by accurately measuring and verifying the controlling software.

Another aspect of the trust decision is the ability of the platform to resist attempts to change the controlling environment. The Intel TXT platform will resist attempts by software processes to change the controlling environment or bypass the bounds set by the controlling environment.

Intel TXT is a set of extensions designed to provide a measured and controlled launch of system software that will then establish a protected environment for itself and any additional software that it may execute.

These extensions enhance two areas:

- The launching of the Measured Launched Environment (MLE).
- The protection of the MLE from potential corruption.

The enhanced platform provides these launch and control interfaces using Safer Mode Extensions (SMX).

The SMX interface includes the following functions:

- Measured/Verified launch of the MLE.
- Mechanisms to ensure the above measurement is protected and stored in a secure location.
- Protection mechanisms that allow the MLE to control attempts to modify itself.

The processor also offers additional enhancements to System Management Mode (SMM) architecture for enhanced security and performance. The processor provides new MSRs to:

- Enable a second SMM range
- Enable SMM code execution range checking
- Select whether SMM Save State is to be written to legacy SMRAM or to MSRs
- Determine if a thread is going to be delayed entering SMM
- Determine if a thread is blocked from entering SMM
- Targeted SMI, enable/disable threads from responding to SMIs both VLWs and IPI

For the above features, BIOS must test the associated capability bit before attempting to access any of the above registers.

For more information, refer to the [Intel® Trusted Execution Technology Measured Launched Environment Programming Guide](#).

3.3 Intel® Hyper-Threading Technology (Intel® HT Technology)

The processor supports Intel Hyper-Threading Technology (Intel HT Technology) that allows an execution core to function as two logical processors. While some execution resources, such as caches, execution units, and buses are shared, each logical processor has its own architectural state with its own set of general-purpose registers and control registers. This feature must be enabled using the BIOS and requires operating system support.

Intel recommends enabling Intel HT Technology with Microsoft Windows* 8 and Microsoft Windows* 7 and disabling Intel HT Technology using the BIOS for all previous versions of Windows* operating systems. For more information on Intel HT Technology, see <http://www.intel.com/technology/platform-technology/hyper-threading/>.

3.4 Intel® Turbo Boost Technology 2.0

The Intel Turbo Boost Technology 2.0 allows the processor core to opportunistically and automatically run faster than its rated operating frequency/render clock, if it is operating below power, temperature, and current limits. The Intel Turbo Boost Technology 2.0 feature is designed to increase performance of both multi-threaded and single-threaded workloads.

The processor supports a Turbo mode in which the processor can use the thermal capacity associated with the package and run at power levels higher than TDP power for short durations. This improves the system responsiveness for short, bursty usage conditions. The turbo feature needs to be properly enabled by BIOS for the processor to operate with maximum performance. Since the turbo feature is configurable and dependent on many platform design limits outside of the processor control, the maximum performance cannot be ensured.

Turbo Mode availability is independent of the number of active cores; however, the Turbo Mode frequency is dynamic and dependent on the instantaneous application power load, the number of active cores, user configurable settings, operating environment, and system design.

Compared with previous generation products, Intel Turbo Boost Technology 2.0 will increase the ratio of application power to TDP. Thus, thermal solutions and platform cooling that are designed to less than thermal design guidance might experience thermal and performance issues since more applications will tend to run at the maximum power limit for significant periods of time.

Note: Intel Turbo Boost Technology 2.0 may not be available on all SKUs.

Intel® Turbo Boost Technology 2.0 Frequency

The processor rated frequency assumes that all execution cores are active and are at the sustained thermal design power (TDP). However, under typical operation not all cores are active or at executing a high power workload. Therefore, most applications are consuming less than the TDP at the rated frequency. Intel Turbo Boost Technology 2.0 takes advantage of the available TDP headroom and active cores are able to increase their operating frequency.

To determine the highest performance frequency amongst active cores, the processor takes the following into consideration to recalculate turbo frequency during runtime:

- The number of cores operating in the C0 state.
- The estimated core current consumption.
- The estimated package prior and present power consumption.
- The package temperature.

Any of these factors can affect the maximum frequency for a given workload. If the power, current, or thermal limit is reached, the processor will automatically reduce the frequency to stay within its TDP limit. Turbo processor frequencies are only active if the operating system is requesting the P0 state. For more information on P-states and C-states, see [Power Management](#) on page 51.

3.5 Intel® Advanced Vector Extensions 2.0 (Intel® AVX2)

Intel Advanced Vector Extensions 2.0 (Intel AVX2) is the latest expansion of the Intel instruction set. Intel AVX2 extends the Intel Advanced Vector Extensions (Intel AVX) with 256-bit integer instructions, floating-point fused multiply add (FMA) instructions, and gather operations. The 256-bit integer vectors benefit math, codec, image, and digital signal processing software. FMA improves performance in face detection, professional imaging, and high performance computing. Gather operations increase vectorization opportunities for many applications. In addition to the vector extensions, this generation of Intel processors adds new bit manipulation instructions useful in compression, encryption, and general purpose software.

For more information on Intel AVX, see <http://www.intel.com/software/avx>

3.6 Intel® Advanced Encryption Standard New Instructions (Intel® AES-NI)

The processor supports Intel Advanced Encryption Standard New Instructions (Intel AES-NI) that are a set of Single Instruction Multiple Data (SIMD) instructions that enable fast and secure data encryption and decryption based on the Advanced Encryption Standard (AES). Intel AES-NI are valuable for a wide range of cryptographic applications, such as applications that perform bulk encryption/decryption, authentication, random number generation, and authenticated encryption. AES is broadly accepted as the standard for both government and industry applications, and is widely deployed in various protocols.

Intel AES-NI consists of six Intel SSE instructions. Four instructions, AESENC, AESENCLAST, AESDEC, and AESDELAST facilitate high performance AES encryption and decryption. The other two, AESIMC and AESKEYGENASSIST, support the AES key expansion procedure. Together, these instructions provide a full hardware for supporting AES; offering security, high performance, and a great deal of flexibility.

PCLMULQDQ Instruction

The processor supports the carry-less multiplication instruction, PCLMULQDQ. PCLMULQDQ is a Single Instruction Multiple Data (SIMD) instruction that computes the 128-bit carry-less multiplication of two, 64-bit operands without generating and propagating carries. Carry-less multiplication is an essential processing component of several cryptographic systems and standards. Hence, accelerating carry-less multiplication can significantly contribute to achieving high speed secure computing and communication.

Intel® Secure Key

The processor supports Intel® Secure Key (formerly known as Digital Random Number Generator (DRNG)), a software visible random number generation mechanism supported by a high quality entropy source. This capability is available to

programmers through the RDRAND instruction. The resultant random number generation capability is designed to comply with existing industry standards in this regard (ANSI X9.82 and NIST SP 800-90).

Some possible usages of the RDRAND instruction include cryptographic key generation as used in a variety of applications, including communication, digital signatures, secure storage, and so on.

3.7 Intel® Transactional Synchronization Extensions - New Instructions (Intel® TSX-NI)

Intel Transactional Synchronization Extensions - New Instructions (Intel TSX-NI). Intel TSX-NI provides a set of instruction extensions that allow programmers to specify regions of code for transactional synchronization. Programmers can use these extensions to achieve the performance of fine-grain locking while actually programming using coarse-grain locks. Details on Intel TSX-NI are in the *Intel® Architecture Instruction Set Extensions Programming Reference*.

3.8 Intel® 64 Architecture x2APIC

The x2APIC architecture extends the xAPIC architecture that provides key mechanisms for interrupt delivery. This extension is primarily intended to increase processor addressability.

Specifically, x2APIC:

- Retains all key elements of compatibility to the xAPIC architecture:
 - Delivery modes
 - Interrupt and processor priorities
 - Interrupt sources
 - Interrupt destination types
- Provides extensions to scale processor addressability for both the logical and physical destination modes
- Adds new features to enhance performance of interrupt delivery
- Reduces complexity of logical destination mode interrupt delivery on link based architectures

The key enhancements provided by the x2APIC architecture over xAPIC are the following:

- Support for two modes of operation to provide backward compatibility and extensibility for future platform innovations:
 - In xAPIC compatibility mode, APIC registers are accessed through memory mapped interface to a 4K-Byte page, identical to the xAPIC architecture.
 - In x2APIC mode, APIC registers are accessed through Model Specific Register (MSR) interfaces. In this mode, the x2APIC architecture provides significantly increased processor addressability and some enhancements on interrupt delivery.
- Increased range of processor addressability in x2APIC mode:

- Physical xAPIC ID field increases from 8 bits to 32 bits, allowing for interrupt processor addressability up to 4G–1 processors in physical destination mode. A processor implementation of x2APIC architecture can support fewer than 32-bits in a software transparent fashion.
- Logical xAPIC ID field increases from 8 bits to 32 bits. The 32-bit logical x2APIC ID is partitioned into two sub-fields – a 16-bit cluster ID and a 16-bit logical ID within the cluster. Consequently, $(2^{20} - 16)$ processors can be addressed in logical destination mode. Processor implementations can support fewer than 16 bits in the cluster ID sub-field and logical ID sub-field in a software agnostic fashion.
- More efficient MSR interface to access APIC registers:
 - To enhance inter-processor and self-directed interrupt delivery as well as the ability to virtualize the local APIC, the APIC register set can be accessed only through MSR-based interfaces in x2APIC mode. The Memory Mapped IO (MMIO) interface used by xAPIC is not supported in x2APIC mode.
- The semantics for accessing APIC registers have been revised to simplify the programming of frequently-used APIC registers by system software. Specifically, the software semantics for using the Interrupt Command Register (ICR) and End Of Interrupt (EOI) registers have been modified to allow for more efficient delivery and dispatching of interrupts.
- The x2APIC extensions are made available to system software by enabling the local x2APIC unit in the “x2APIC” mode. To benefit from x2APIC capabilities, a new operating system and a new BIOS are both needed, with special support for x2APIC mode.
- The x2APIC architecture provides backward compatibility to the xAPIC architecture and forward extendible for future Intel platform innovations.

Note: Intel x2APIC Technology may not be available on all SKUs.

For more information, see the *Intel® 64 Architecture x2APIC Specification* at <http://www.intel.com/products/processor/manuals/>.

3.9 Power Aware Interrupt Routing (PAIR)

The processor includes enhanced power-performance technology that routes interrupts to threads or cores based on their sleep states. As an example, for energy savings, it routes the interrupt to the active cores without waking the deep idle cores. For performance, it routes the interrupt to the idle (C1) cores without interrupting the already heavily loaded cores. This enhancement is mostly beneficial for high-interrupt scenarios like Gigabit LAN, WLAN peripherals, and so on.

3.10 Execute Disable Bit

The Execute Disable Bit allows memory to be marked as executable when combined with a supporting operating system. If code attempts to run in non-executable memory, the processor raises an error to the operating system. This feature can prevent some classes of viruses or worms that exploit buffer overrun vulnerabilities and can thus help improve the overall security of the system. See the *Intel® 64 and IA-32 Architectures Software Developer's Manuals* for more detailed information.

3.11 Supervisor Mode Execution Protection (SMEP)

Supervisor Mode Execution Protection provides the next level of system protection by blocking malicious software attacks from user mode code when the system is running in the highest privilege level. This technology helps to protect from virus attacks and unwanted code from harming the system. For more information, refer to *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A* at: <http://www.intel.com/Assets/PDF/manual/253668.pdf>

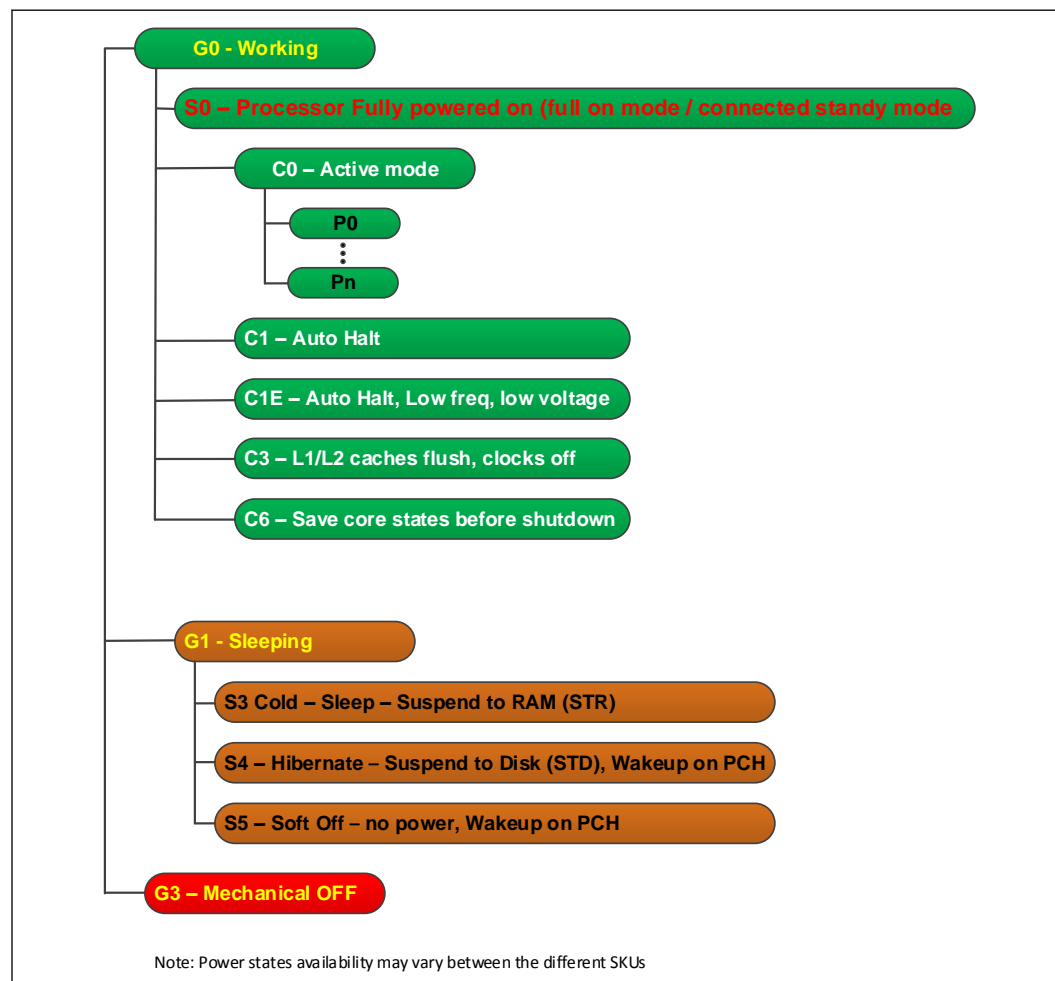

4.0 Power Management

This chapter provides information on the following power management topics:

- Advanced Configuration and Power Interface (ACPI) States
- Processor Core
- Integrated Memory Controller (IMC)
- PCI Express*
- Direct Media Interface (DMI)
- Processor Graphics Controller

Figure 11. Processor Power States

4.1 Advanced Configuration and Power Interface (ACPI) States Supported

This section describes the ACPI states supported by the processor.

Table 10. System States

State	Description
G0/S0	Full On Mode, Display On.
G0/S0	Connected Standby Mode, Display Off.
G1/S3-Cold	Suspend-to-RAM (STR). Context saved to memory (S3-Hot state is not supported by the processor).
G1/S4	Suspend-to-Disk (STD). All power lost (except wakeup on PCH).
G2/S5	Soft off. All power lost (except wakeup on PCH). Total reboot.
G3	Mechanical off. All power (AC and battery) removed from system.

Table 11. Processor Core / Package State Support

State	Description
C0	Active mode, processor executing code.
C1	AutoHALT state.
C1E	AutoHALT state with lowest frequency and voltage operating point.
C3	Execution cores in C3 state flush their L1 instruction cache, L1 data cache, and L2 cache to the L3 shared cache. Clocks are shut off to each core.
C6	Execution cores in this state save their architectural state before removing core voltage.

Table 12. Integrated Memory Controller States

State	Description
Power up	CKE asserted. Active mode.
Pre-charge Power-down	CKE de-asserted (not self-refresh) with all banks closed.
Active Power-down	CKE de-asserted (not self-refresh) with minimum one bank active.
Self-Refresh	CKE de-asserted using device self-refresh.

Table 13. PCI Express* Link States

State	Description
L0	Full on – Active transfer state.
L0s	First Active Power Management low-power state – Low exit latency.
L1	Lowest Active Power Management – Longer exit latency.
L3	Lowest power state (power-off) – Longest exit latency.

**Table 14. Direct Media Interface (DMI) States**

State	Description
L0	Full on – Active transfer state.
L0s	First Active Power Management low-power state – Low exit latency.
L1	Lowest Active Power Management – Longer exit latency.
L3	Lowest power state (power-off) – Longest exit latency.

Table 15. G, S, and C Interface State Combinations

Global (G) State	Sleep (S) State	Processor Package (C) State	Processor State	System Clocks	Description
G0	S0	C0	Full On	On	Full On
G0	S0	C1/C1E	Auto-Halt	On	Auto-Halt
G0	S0	C3	Deep Sleep	On	Deep Sleep
G0	S0	C6	Deep Power-down	On	Deep Power-down
G1	S3	Power off		Off, except RTC	Suspend to RAM
G1	S4	Power off		Off, except RTC	Suspend to Disk
G2	S5	Power off		Off, except RTC	Soft Off
G3	NA	Power off		Power off	Hard off

Table 16. D, S, and C Interface State Combination

Graphics Adapter (D) State	Sleep (S) State	Package (C) State	Description
D0	S0	C0	Full On, Displaying.
D0	S0	C1/C1E	Auto-Halt, Displaying.
D0	S0	C3	Deep sleep, Displaying.
D0	S0	C6	Deep Power-down, Displaying.
D3	S0	Any	Not displaying.
D3	S3	N/A	Not displaying, Graphics Core is powered off.
D3	S4	N/A	Not displaying, suspend to disk.

4.2 Processor Core Power Management

While executing code, Enhanced Intel SpeedStep® Technology optimizes the processor's frequency and core voltage based on workload. Each frequency and voltage operating point is defined by ACPI as a P-state. When the processor is not executing code, it is idle. A low-power idle state is defined by ACPI as a C-state. In general, deeper power C-states have longer entry and exit latencies.

4.2.1 Enhanced Intel SpeedStep® Technology Key Features

The following are the key features of Enhanced Intel SpeedStep Technology:

- Multiple frequency and voltage points for optimal performance and power efficiency. These operating points are known as P-states.
- Frequency selection is software controlled by writing to processor MSRs. The voltage is optimized based on the selected frequency and the number of active processor cores.
 - Once the voltage is established, the PLL locks on to the target frequency.
 - All active processor cores share the same frequency and voltage. In a multi-core processor, the highest frequency P-state requested among all active cores is selected.
 - Software-requested transitions are accepted at any time. If a previous transition is in progress, the new transition is deferred until the previous transition is completed.
- The processor controls voltage ramp rates internally to ensure glitch-free transitions.
- Because there is low transition latency between P-states, a significant number of transitions per-second are possible.

4.2.2 Low-Power Idle States

When the processor is idle, low-power idle states (C-states) are used to save power. More power savings actions are taken for numerically higher C-states. However, higher C-states have longer exit and entry latencies. Resolution of C-states occur at the thread, processor core, and processor package level. Thread-level C-states are available if Intel Hyper-Threading Technology is enabled.

Caution: Long term reliability cannot be assured unless all the Low-Power Idle States are enabled.

Figure 12. Idle Power Management Breakdown of the Processor Cores

Entry and exit of the C-states at the thread and core level are shown in the following figure.

Figure 13. Thread and Core C-State Entry and Exit

While individual threads can request low-power C-states, power saving actions only take place once the core C-state is resolved. Core C-states are automatically resolved by the processor. For thread and core C-states, a transition to and from C0 is required before entering any other C-state.

Table 17. Coordination of Thread Power States at the Core Level

Processor Core C-State		Thread 1			
		C0	C1	C3	C6
Thread 0	C0	C0	C0	C0	C0
	C1	C0	C1 ¹	C1 ¹	C1 ¹
	C3	C0	C1 ¹	C3	C3
	C6	C0	C1 ¹	C3	C6

Note: 1. If enabled, the core C-state will be C1E if all cores have resolved a core C1 state or higher.

4.2.3 Requesting Low-Power Idle States

The primary software interfaces for requesting low-power idle states are through the MWAIT instruction with sub-state hints and the HLT instruction (for C1 and C1E). However, software may make C-state requests using the legacy method of I/O reads from the ACPI-defined processor clock control registers, referred to as P_LVLx. This method of requesting C-states provides legacy support for operating systems that initiate C-state transitions using I/O reads.

For legacy operating systems, P_LVLx I/O reads are converted within the processor to the equivalent MWAIT C-state request. Therefore, P_LVLx reads do not directly result in I/O reads to the system. The feature, known as I/O MWAIT redirection, must be enabled in the BIOS.

The BIOS can write to the C-state range field of the PMG_IO_CAPTURE MSR to restrict the range of I/O addresses that are trapped and emulate MWAIT like functionality. Any P_LVLx reads outside of this range do not cause an I/O redirection to MWAIT(Cx) like request. The reads fall through like a normal I/O instruction.

Note: When P_LVLx I/O instructions are used, MWAIT sub-states cannot be defined. The MWAIT sub-state is always zero if I/O MWAIT redirection is used. By default, P_LVLx I/O redirections enable the MWAIT 'break on EFLAGS.IF' feature that triggers a wakeup on an interrupt, even if interrupts are masked by EFLAGS.IF.

4.2.4 Core C-State Rules

The following are general rules for all core C-states, unless specified otherwise:

- A core C-state is determined by the lowest numerical thread state (such as Thread 0 requests C1E state while Thread 1 requests C3 state, resulting in a core C1E state). See the *G, S, and C Interface State Combinations* table.
- A core transitions to C0 state when:
 - An interrupt occurs
 - There is an access to the monitored address if the state was entered using an MWAIT/Timed MWAIT instruction
 - The deadline corresponding to the Timed MWAIT instruction expires
- An interrupt directed toward a single thread wakes only that thread.
- If any thread in a core is in active (in C0 state), the core's C-state will resolve to C0 state.
- Any interrupt coming into the processor package may wake any core.
- A system reset re-initializes all processor cores.

Core C0 State

The normal operating state of a core where code is being executed.

Core C1/C1E State

C1/C1E is a low power state entered when all threads within a core execute a HLT or MWAIT(C1/C1E) instruction.

A System Management Interrupt (SMI) handler returns execution to either Normal state or the C1/C1E state. See the *Intel® 64 and IA-32 Architectures Software Developer's Manual* for more information.

While a core is in C1/C1E state, it processes bus snoops and snoops from other threads. For more information on C1E state, see [Package C-States](#) on page 57.

Core C3 State

Individual threads of a core can enter the C3 state by initiating a P_LVL2 I/O read to the P_BLK or an MWAIT(C3) instruction. A core in C3 state flushes the contents of its L1 instruction cache, L1 data cache, and L2 cache to the shared L3 cache, while maintaining its architectural state. All core clocks are stopped at this point. Because the core's caches are flushed, the processor does not wake any core that is in the C3 state when either a snoop is detected or when another core accesses cacheable memory.

Core C6 State

Individual threads of a core can enter the C6 state by initiating a P_LVL3 I/O read or an MWAIT(C6) instruction. Before entering core C6 state, the core will save its architectural state to a dedicated SRAM. Once complete, a core will have its voltage reduced to zero volts. During exit, the core is powered on and its architectural state is restored.

C-State Auto-Demotion

In general, deeper C-states, such as C6 state, have long latencies and have higher energy entry/exit costs. The resulting performance and energy penalties become significant when the entry/exit frequency of a deeper C-state is high. Therefore, incorrect or inefficient usage of deeper C-states have a negative impact on battery life and idle power. To increase residency and improve battery life and idle power in deeper C-states, the processor supports C-state auto-demotion.

There are two C-state auto-demotion options:

- C6 to C3 state
- C6/C3 To C1 state

The decision to demote a core from C6 to C3 or C3/C6 to C1 state is based on each core's immediate residency history and interrupt rate. If the interrupt rate experienced on a core is high and the residence in a deep C-state between such interrupts is low, the core can be demoted to a C3 or C1 state. A higher interrupt pattern is required to demote a core to C1 state as compared to C3 state.

This feature is disabled by default. BIOS must enable it in the PMG_CST_CONFIG_CONTROL register. The auto-demotion policy is also configured by this register.

4.2.5 Package C-States

The processor supports C0, C1/C1E, C3, and C6 power states. The following is a summary of the general rules for package C-state entry. These apply to all package C-states, unless specified otherwise:

- A package C-state request is determined by the lowest numerical core C-state amongst all cores.
- A package C-state is automatically resolved by the processor depending on the core idle power states and the status of the platform components.
 - Each core can be at a lower idle power state than the package if the platform does not grant the processor permission to enter a requested package C-state.
 - The platform may allow additional power savings to be realized in the processor.
 - For package C-states, the processor is not required to enter C0 state before entering any other C-state.
 - Entry into a package C-state may be subject to auto-demotion – that is, the processor may keep the package in a deeper package C-state than requested by the operating system if the processor determines, using heuristics, that the deeper C-state results in better power/performance.

The processor exits a package C-state when a break event is detected. Depending on the type of break event, the processor does the following:

- If a core break event is received, the target core is activated and the break event message is forwarded to the target core.
 - If the break event is not masked, the target core enters the core C0 state and the processor enters package C0 state.
 - If the break event is masked, the processor attempts to re-enter its previous package state.
- If the break event was due to a memory access or snoop request,
 - But the platform did not request to keep the processor in a higher package C-state, the package returns to its previous C-state.
 - And the platform requests a higher power C-state, the memory access or snoop request is serviced and the package remains in the higher power C-state.

The following table shows package C-state resolution for a dual-core processor. The following figure summarizes package C-state transitions.

Table 18. Coordination of Core Power States at the Package Level

Package C-State		Core 1			
		C0	C1	C3	C6
Core 0	C0	C0	C0	C0	C0
	C1	C0	C1 ¹	C1 ¹	C1 ¹
	C3	C0	C1 ¹	C3	C3
	C6	C0	C1 ¹	C3	C6
Note: 1. If enabled, the package C-state will be C1E if all cores have resolved a core C1 state or higher.					

Figure 14. Package C-State Entry and Exit**Package C0 State**

This is the normal operating state for the processor. The processor remains in the normal state when at least one of its cores is in the C0 or C1 state or when the platform has not granted permission to the processor to go into a low-power state. Individual cores may be in lower power idle states while the package is in C0 state.

Package C1/C1E State

No additional power reduction actions are taken in the package C1 state. However, if the C1E sub-state is enabled, the processor automatically transitions to the lowest supported core clock frequency, followed by a reduction in voltage.

The package enters the C1 low-power state when:

- At least one core is in the C1 state.
- The other cores are in a C1 or deeper power state.

The package enters the C1E state when:

- All cores have directly requested C1E using MWAIT(C1) with a C1E sub-state hint.
- All cores are in a power state deeper than C1/C1E state; however, the package low-power state is limited to C1/C1E using the PMG_CST_CONFIG_CONTROL MSR.
- All cores have requested C1 state using HLT or MWAIT(C1) and C1E auto-promotion is enabled in IA32_MISC_ENABLES.

No notification to the system occurs upon entry to C1/C1E state.

Package C2 State

Package C2 state is an internal processor state that cannot be explicitly requested by software. A processor enters Package C2 state when:

- All cores and graphics have requested a C3 or deeper power state; however, constraints (LTR, programmed timer events in the near future, and so on) prevent entry to any state deeper than C 2 state. Or,
- All cores and graphics are in the C3 or deeper power states, and a memory access request is received. Upon completion of all outstanding memory requests, the processor transitions back into a deeper package C-state.

Package C3 State

A processor enters the package C3 low-power state when:

- At least one core is in the C3 state.
- The other cores are in a C3 state or deeper power state and the processor has been granted permission by the platform.
- The platform has not granted a request to a package C6 or deeper state, however, has allowed a package C6 state.

In package C3 state, the L3 shared cache is valid.

Package C6 State

A processor enters the package C6 low-power state when:

- At least one core is in the C6 state.
- The other cores are in a C6 or deeper power state and the processor has been granted permission by the platform.
- The platform has not granted a package C7 state or deeper request; however, has allowed a package C6 state.
- If the cores are requesting C7 state, but the platform is limiting to a package C6 state, the last level cache in this case can be flushed.

In package C6 state all cores have saved their architectural state and have had their core voltages reduced to zero volts. It is possible the L3 shared cache is flushed and turned off in package C6 state. If at least one core is requesting C6 state, the L3 cache will not be flushed.

4.2.6 Package C-States and Display Resolutions

The integrated graphics engine has the frame buffer located in system memory. When the display is updated, the graphics engine fetches display data from system memory. Different screen resolutions and refresh rates have different memory latency requirements. These requirements may limit the deepest Package C-state the processor can enter. Other elements that may affect the deepest Package C-state available are the following:

- Display is on or off
- Single or multiple displays
- Native or non-native resolution

- Panel Self Refresh (PSR) technology

Note: Display resolution is not the only factor influencing the deepest Package C-state the processor can get into. Device latencies, interrupt response latencies, and core C-states are among other factors that influence the final package C-state the processor can enter.

The following table lists display resolutions and deepest available package C-State. The display resolutions are examples using common values for blanking and pixel rate. Actual results will vary. The table shows the deepest possible Package C-state. System workload, system idle, and AC or DC power also affect the deepest possible Package C-state.

Table 19. Deepest Package C-State Available

Panel Self Refresh (PSR)	Number of Displays ¹	Native Resolution ²	Deepest Available Package C-State
Disabled	Single	800x600 60 Hz	PC6
Disabled	Single	1024x768 60 Hz	PC6
Disabled	Single	1280x1024 60 Hz	PC6
Disabled	Single	1920x1080 60 Hz	PC6
Disabled	Single	1920x1200 60 Hz	PC6
Disabled	Single	1920x1440 60 Hz	PC6
Disabled	Single	2048x1536 60 Hz	PC6
Disabled	Single	2560x1600 60 Hz	PC6
Disabled	Single	2560x1920 60 Hz	PC3
Disabled	Single	2880x1620 60 Hz	PC3
Disabled	Single	2880x1800 60 Hz	PC3
Disabled	Single	3200x1800 60 Hz	PC3
Disabled	Single	3200x2000 60 Hz	PC3
Disabled	Single	3840x2160 60 Hz	PC3
Disabled	Single	3840x2160 30 Hz	PC3
Disabled	Single	4096x2160 24 Hz	PC3
Disabled	Multiple	800x600 60 Hz	PC6
Disabled	Multiple	1024x768 60 Hz	PC6
Disabled	Multiple	1280x1024 60 Hz	PC6
Disabled	Multiple	1920x1080 60 Hz	PC3
Disabled	Multiple	1920x1200 60 Hz	PC3
Disabled	Multiple	1920x1440 60 Hz	PC3
Disabled	Multiple	2048x1536 60 Hz	PC3
Disabled	Multiple	2560x1600 60 Hz	PC2
Disabled	Multiple	2560x1920 60 Hz	PC2
Disabled	Multiple	2880x1620 60 Hz	PC2
<i>continued...</i>			

Panel Self Refresh (PSR)	Number of Displays ¹	Native Resolution ²	Deepest Available Package C-State
Disabled	Multiple	2880x1800 60 Hz	PC2
Disabled	Multiple	3200x1800 60 Hz	PC2
Disabled	Multiple	3200x2000 60 Hz	PC2
Disabled	Multiple	3840x2160 60 Hz	PC2
Disabled	Multiple	3840x2160 30 Hz	PC2
Disabled	Multiple	4096x2160 24 Hz	PC2
Enabled	Multiple	Any native resolution ¹	Same as PSR disabled for the given resolution with multiple displays

Notes: 1. For multiple display cases, the resolution listed is the highest native resolution of all enabled displays, and PSR is internally disabled; that is, dual display with one 800x600 60 Hz display and one 2560x1600 60 Hz display will result in a deepest available package C-state of PC2.
2. For non-native resolutions, PSR is internally disabled, and the deepest available package C-State will be between that of the PSR disabled native resolution and the PSR disabled non-native resolution; that is, a native 3200x1800 60 Hz panel using non-native 1920x1080 60 Hz resolution will result in a deepest available package C-State between PC3 and PC6.
3. Microcode Update Revision 00000010 or newer must be used.

4.3 Integrated Memory Controller (IMC) Power Management

The main memory is power managed during normal operation and in low-power ACPI Cx states.

4.3.1 Disabling Unused System Memory Outputs

Any system memory (SM) interface signal that goes to a memory module connector in which it is not connected to any actual memory devices (such as SO-DIMM connector is unpopulated, or is single-sided) is tri-stated. The benefits of disabling unused SM signals are:

- Reduced power consumption.
- Reduced possible overshoot/undershoot signal quality issues seen by the processor I/O buffer receivers caused by reflections from potentially unterminated transmission lines.

When a given rank is not populated, the corresponding chip select and CKE signals are not driven.

At reset, all rows must be assumed to be populated, until it can be determined that the rows are not populated. This is due to the fact that when CKE is tri-stated with an SO-DIMM present, the SO-DIMM is not ensured to maintain data integrity.

CKE tri-state should be enabled by BIOS where appropriate, since at reset all rows must be assumed to be populated.

4.3.2 DRAM Power Management and Initialization

The processor implements extensive support for power management on the SDRAM interface. There are four SDRAM operations associated with the Clock Enable (CKE) signals, which the SDRAM controller supports. The processor drives four CKE pins to perform these operations.

The CKE is one of the power save means. When CKE is off, the internal DDR clock is disabled and the DDR power is reduced. The power saving differs according to the selected mode and the DDR type used. For more information, refer to the IDD table in the DDR specification.

The processor supports three different types of power-down modes in package C0. The different power-down modes can be enabled through configuring "PM_PDWN_config_0_0_0_MCHBAR". The type of CKE power-down can be configured through PDWN_mode (bits 15:12) and the idle timer can be configured through PDWN_idle_counter (bits 11:0). The different power-down modes supported are:

- **No power-down** (CKE disable)
- **Active power-down (APD):** This mode is entered if there are open pages when de-asserting CKE. In this mode the open pages are retained. Power-saving in this mode is the lowest. Power consumption of DDR is defined by IDD3P. Exiting this mode is defined by tXP – small number of cycles. For this mode, DRAM DLL must be on.
- **PPD/DLL-off:** In this mode the data-in DLLs on DDR are off. Power-saving in this mode is the best among all power modes. Power consumption is defined by IDD2P1. Exiting this mode is defined by tXP, but also tXPDLL (10–20 according to DDR type) cycles until first data transfer is allowed. For this mode, DRAM DLL must be off.

The CKE is determined per rank, whenever it is inactive. Each rank has an idle-counter. The idle-counter starts counting as soon as the rank has no accesses, and if it expires, the rank may enter power-down while no new transactions to the rank arrives to queues. The idle-counter begins counting at the last incoming transaction arrival.

It is important to understand that since the power-down decision is per rank, the IMC can find many opportunities to power down ranks, even while running memory intensive applications; the savings are significant (may be few Watts, according to the DDR specification). This is significant when each channel is populated with more ranks.

Selection of power modes should be according to power-performance or thermal trade-offs of a given system:

- When trying to achieve maximum performance and power or thermal consideration is not an issue – use no power-down
- In a system which tries to minimize power-consumption, try using the deepest power-down mode possible – PPD/DLL-off with a low idle timer value.
- In high-performance systems with dense packaging (that is, tricky thermal design) the power-down mode should be considered in order to reduce the heating and avoid DDR throttling caused by the heating.

The default value that BIOS configures in "PM_PDWN_config_0_0_0_MCHBAR" is 6080h; that is, PPD/DLL-off mode with idle timer of 80h, or 128 DCLKs. This is a balanced setting with deep power-down mode and moderate idle timer value.

The idle timer expiration count defines the number of DCLKs that a rank is idle that causes entry to the selected power mode. As this timer is set to a shorter time, the IMC will have more opportunities to put DDR in power-down. There is no BIOS hook to set this register. Customers choosing to change the value of this register can do it by changing it in the BIOS. For experiments, this register can be modified in real time if BIOS does not lock the IMC registers.

4.3.2.1 Initialization Role of CKE

During power-up, CKE is the only input to the SDRAM that has its level recognized (other than the DDR3L/DDR3L-RS reset pin) once power is applied. It must be driven LOW by the DDR controller to make sure the SDRAM components float DQ and DQS during power-up. CKE signals remain LOW (while any reset is active) until the BIOS writes to a configuration register. Using this method, CKE is ensured to remain inactive for much longer than the specified 200 micro-seconds after power and clocks to SDRAM devices are stable.

4.3.2.2 Conditional Self-Refresh

During S0 idle state, system memory may be conditionally placed into self-refresh state when the processor is in package C3 or deeper power state. Refer to [Intel® Rapid Memory Power Management \(Intel® RMPM\)](#) for more details on conditional self-refresh with Intel HD Graphics enabled.

When entering the S3 – Suspend-to-RAM (STR) state or S0 conditional self-refresh, the processor core flushes pending cycles and then enters SDRAM ranks that are not used by Intel graphics memory into self-refresh. The CKE signals remain LOW so the SDRAM devices perform self-refresh.

The target behavior is to enter self-refresh for package C3 or deeper power states as long as there are no memory requests to service. The target usage is shown in the following table.

Table 20. Targeted Memory State Conditions

Mode	Memory State with Processor Graphics	Memory State with External Graphics
C0, C1, C1E	Dynamic memory rank power-down based on idle conditions.	Dynamic memory rank power-down based on idle conditions.
C3, C6	If the processor graphics engine is idle and there are no pending display requests, then enter self-refresh. Otherwise, use dynamic memory rank power-down based on idle conditions.	If there are no memory requests, then enter self-refresh. Otherwise, use dynamic memory rank power-down based on idle conditions.
S3	Self-Refresh Mode	Self-Refresh Mode
S4	Memory power-down (contents lost)	Memory power-down (contents lost)

4.3.2.3 Dynamic Power-Down

Dynamic power-down of memory is employed during normal operation. Based on idle conditions, a given memory rank may be powered down. The IMC implements aggressive CKE control to dynamically put the DRAM devices in a power-down state. The processor core controller can be configured to put the devices in active power-down (CKE de-assertion with open pages) or pre-charge power-down (CKE de-assertion with all pages closed). Pre-charge power-down provides greater power savings, but has a bigger performance impact since all pages will first be closed before putting the devices in power-down mode.

If dynamic power-down is enabled, all ranks are powered up before doing a refresh cycle and all ranks are powered down at the end of refresh.

4.3.2.4 DRAM I/O Power Management

Unused signals should be disabled to save power and reduce electromagnetic interference. This includes all signals associated with an unused memory channel. Clocks, CKE, ODE, and CS signals are controlled per DIMM rank and will be powered down for unused ranks.

The I/O buffer for an unused signal should be tri-stated (output driver disabled), the input receiver (differential sense-amp) should be disabled, and any DLL circuitry related ONLY to unused signals should be disabled. The input path must be gated to prevent spurious results due to noise on the unused signals (typically handled automatically when input receiver is disabled).

4.3.3 DRAM Running Average Power Limitation (RAPL)

RAPL is a power and time constant pair. DRAM RAPL defines an average power constraint for the DRAM domain. Constraint is controlled by the PCU. Platform entities (PECI or in-band power driver) can specify a power limit for the DRAM domain. PCU continuously monitors the extent of DRAM throttling due to the power limit and rebudgets the limit between DIMMs.

4.3.4 DDR Electrical Power Gating (EPG)

The DDR I/O of the processor supports Electrical Power Gating (DDR-EPG) while the processor is at C3 or deeper power state.

In C3 or deeper power state, the processor internally gates V_{DDQ} for the majority of the logic to reduce idle power while keeping all critical DDR pins such as SM_DRAMRST#, CKE and VREF in the appropriate state.

In S3 or C-state transitions, the DDR does not go through training mode and will restore the previous training information.

4.4 PCI Express* Power Management

- Active power management is supported using L0s, and L1 states.
- All inputs and outputs disabled in L2/L3 Ready state.

4.5 Direct Media Interface (DMI) Power Management

Active power management is supported using L0s/L1 state.

4.6 Graphics Power Management

4.6.1 Intel® Rapid Memory Power Management (Intel® RMPM)

Intel Rapid Memory Power Management (Intel RMPM) conditionally places memory into self-refresh when the processor is in package C3 or deeper power state to allow the system to remain in the lower power states longer for memory not reserved for graphics memory. Intel RMPM functionality depends on graphics/display state (relevant only when processor graphics is being used), as well as memory traffic patterns generated by other connected I/O devices.

4.6.2 Graphics Render C-State

Render C-state (RC6) is a technique designed to optimize the average power to the graphics render engine during times of idleness. RC6 is entered when the graphics render engine, blitter engine, and the video engine have no workload being currently worked on and no outstanding graphics memory transactions. When the idleness condition is met, the processor graphics will program the graphics render engine internal power rail into a low voltage state.

4.6.3 Intel® Smart 2D Display Technology (Intel® S2DDT)

Intel S2DDT reduces display refresh memory traffic by reducing memory reads required for display refresh. Power consumption is reduced by less accesses to the IMC. Intel S2DDT is only enabled in single pipe mode.

Intel S2DDT is most effective with:

- Display images well suited to compression, such as text windows, slide shows, and so on. Poor examples are 3D games.
- Static screens such as screens with significant portions of the background showing 2D applications, processor benchmarks, and so on, or conditions when the processor is idle. Poor examples are full-screen 3D games and benchmarks that flip the display image at or near display refresh rates.

4.6.4 Intel® Graphics Dynamic Frequency

Intel Graphics Dynamic Frequency Technology is the ability of the processor and graphics cores to opportunistically increase frequency and/or voltage above the guaranteed processor and graphics frequency for the given part. Intel Graphics Dynamic Frequency Technology is a performance feature that makes use of unused package power and thermals to increase application performance. The increase in frequency is determined by how much power and thermal budget is available in the package, and the application demand for additional processor or graphics performance. The processor core control is maintained by an embedded controller. The graphics driver dynamically adjusts between P-States to maintain optimal performance, power, and thermals. The graphics driver will always try to place the graphics engine in the most energy efficient P-state.

4.6.5 Intel® Display Power Saving Technology (Intel® DPST)

The Intel DPST technique achieves backlight power savings while maintaining a good visual experience. This is accomplished by adaptively enhancing the displayed image while decreasing the backlight brightness simultaneously. The goal of this technique is to provide equivalent end-user-perceived image quality at a decreased backlight power level.

1. The original (input) image produced by the operating system or application is analyzed by the Intel DPST subsystem. An interrupt to Intel DPST software is generated whenever a meaningful change in the image attributes is detected. (A meaningful change is when the Intel DPST software algorithm determines that enough brightness, contrast, or color change has occurred to the displaying images that the image enhancement and backlight control needs to be altered.)
2. Intel DPST subsystem applies an image-specific enhancement to increase image contrast, brightness, and other attributes.

3. A corresponding decrease to the backlight brightness is applied simultaneously to produce an image with similar user-perceived quality (such as brightness) as the original image.

Intel DPST 6.0 has improved the software algorithms and has minor hardware changes to better handle backlight phase-in and ensures the documented and validated method to interrupt hardware phase-in.

4.6.6 Intel® Automatic Display Brightness

The Intel Automatic Display Brightness feature dynamically adjusts the backlight brightness based upon the current ambient light environment. This feature requires an additional sensor to be on the panel front. The sensor receives the changing ambient light conditions and sends the interrupts to the Intel Graphics driver. As per the change in Lux, (current ambient light illuminance), the new backlight setting can be adjusted through BLC. The converse applies for a brightly lit environment. Intel Automatic Display Brightness increases the backlight setting.

4.6.7 Intel® Seamless Display Refresh Rate Technology (Intel® SDRRS Technology)

When a Local Flat Panel (LFP) supports multiple refresh rates, the Intel Display Refresh Rate Switching power conservation feature can be enabled. The higher refresh rate will be used when plugged in with an AC power adaptor or when the end user has not selected/enabled this feature. The graphics software will automatically switch to a lower refresh rate for maximum battery life when the notebook is on battery power and when the user has selected/enabled this feature. There are two distinct implementations of Intel DRRS – static and seamless. The static Intel DRRS method uses a mode change to assign the new refresh rate. The seamless Intel DRRS method is able to accomplish the refresh rate assignment without a mode change and therefore does not experience some of the visual artifacts associated with the mode change (SetMode) method.

5.0 Thermal Management

The thermal solution provides both component-level and system-level thermal management. To allow for the optimal operation and long-term reliability of Intel processor-based systems, the system/processor thermal solution should be designed so that the processor:

- Remains below the maximum junction temperature ($T_{j\text{Max}}$) specification at the maximum thermal design power (TDP).
- Conforms to system constraints, such as system acoustics, system skin-temperatures, and exhaust-temperature requirements.

Caution: Thermal specifications given in this chapter are on the component and package level and apply specifically to the processor. Operating the processor outside the specified limits may result in permanent damage to the processor and potentially other components in the system.

5.1 Thermal Considerations

The processor TDP is the maximum sustained power that should be used for design of the processor thermal solution. TDP represents an expected maximum sustained power from realistic applications. TDP may be exceeded for short periods of time or if running a "power virus" workload.

The processor integrates multiple processing and graphics cores on a single die. This may result in differences in the power distribution across the die and must be considered when designing the thermal solution.

Intel® Turbo Boost Technology 2.0 allows processor cores and processor graphics cores to run faster than the guaranteed frequency. It is invoked opportunistically and automatically as long as the processor is conforming to its temperature, power delivery, and current specification limits. When Intel Turbo Boost Technology 2.0 is enabled:

- Applications are expected to run closer to TDP more often as the processor will attempt to maximize performance by taking advantage of available TDP headroom in the processor package.
- The processor may exceed the TDP for short durations to use any available thermal capacitance within the thermal solution. The duration and time of such operation can be limited by platform runtime configurable registers within the processor.
- Thermal solutions and platform cooling that are designed to less than thermal design guidance may experience thermal and performance issues since more applications will tend to run at or near TDP for significant periods of time.

Note: Intel Turbo Boost Technology 2.0 availability may vary between the different SKUs.

5.2 Intel® Turbo Boost Technology 2.0 Power Monitoring

When operating in turbo mode, the processor monitors its own power and adjusts the turbo frequencies to maintain the average power within limits over a thermally significant time period. The processor calculates the package power that consists of the processor core power and graphics core power. In the event that a workload causes the power to exceed program power limits, the processor will protect itself using the Adaptive Thermal Monitor.

5.3 Intel® Turbo Boost Technology 2.0 Power Control

Illustration of Intel Turbo Boost Technology 2.0 power control is shown in the following sections and figures. Multiple controls operate simultaneously allowing for customization for multiple system thermal and power limitations. These controls allow for turbo optimizations within system constraints and are accessible using MSR, MMIO, or PECI interfaces.

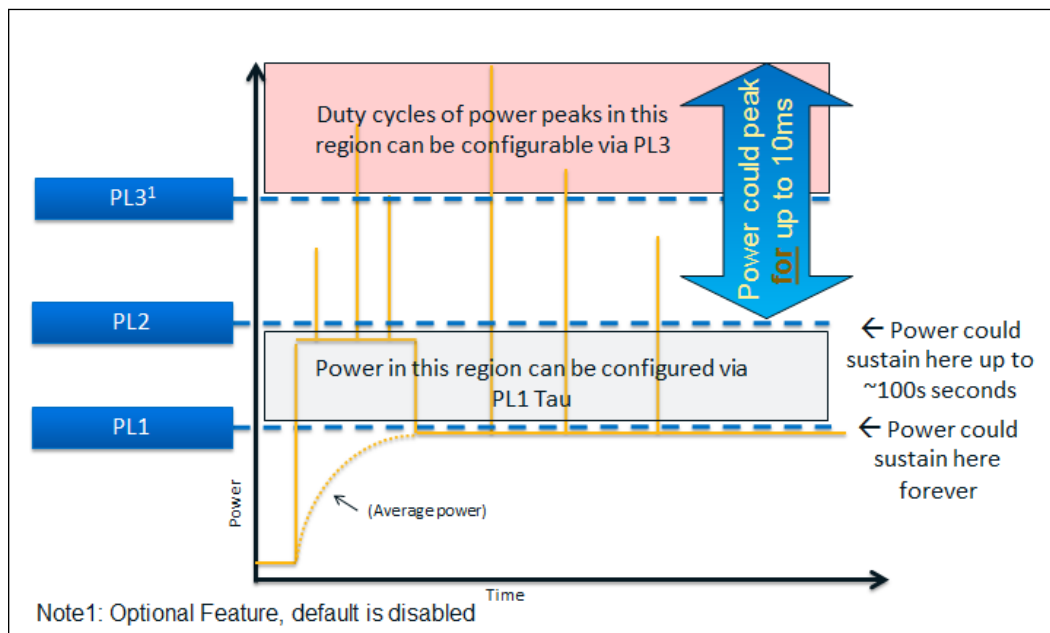

5.3.1 Package Power Control

The package power control settings of PL1, PL2, and PL3 Tau allow the designer to configure Intel Turbo Boost Technology 2.0 to match the platform power delivery and package thermal solution limitations.

- Power Limit 1 (PL1): A threshold for average power that will not exceed; recommend to set equal to TDP power. PL1 should not be set higher than thermal solution cooling limits.
- Power Limit 2 (PL2): A threshold that if exceeded, the PL2 rapid power limiting algorithms will attempt to limit the spike above PL2.
- Power Limit 3 (PL3): A threshold that if exceeded, the PL3 rapid power limiting algorithms will attempt to limit the duty cycle of spikes above PL3 by reactively limiting frequency. This is an optional setting.
- Turbo Time Parameter (Tau): An averaging constant used for PL1 exponential weighted moving average (EWMA) power calculation.

- Notes:**
1. Implementation of Intel Turbo Boost Technology 2.0 only requires configuring PL1, PL1 Tau, and PL2.
 2. PL3 is disabled by default.

Figure 15. Package Power Control

5.3.2 Turbo Time Parameter

Turbo Time Parameter is a mathematical parameter (units in seconds) that controls the Intel Turbo Boost Technology 2.0 algorithm using moving average of energy usage. During a maximum power turbo event of about $1.25 \times \text{TDP}$, the processor could sustain PL2 for up to approximately 1.5 times the Turbo Time Parameter. If the power value and/or Turbo Time Parameter is changed during runtime, it may take approximately 3 to 5 times the Turbo Time Parameter for the algorithm to settle at the new control limits. The time varies depending on the magnitude of the change and other factors. There is an individual Turbo Time Parameter associated with Package Power Control.

5.4 Configurable TDP (cTDP) and Low-Power Mode

Configurable TDP (cTDP) and Low-Power Mode (LPM) form a design vector where the processor's behavior and package TDP are dynamically adjusted to a desired system performance and power envelope. Configurable TDP and Low-Power Mode technologies offer opportunities to differentiate system design while running active workloads on select processor SKUs through scalability, configuration and adaptability. The scenarios or methods by which each technology is used are customizable but typically involve changes to PL1 and associated frequencies for the scenario with a resultant change in performance depending on system's usage. Either technology can be triggered by (but are not limited to) changes in OS power policies or hardware events such as docking a system, flipping a switch or pressing a button. cTDP and LPM are designed to be configured dynamically and do not require an operating system reboot.

Note: Configurable TDP and Low-Power Mode technologies are not battery life improvement technologies.

5.4.1 Configurable TDP

Note: Configurable TDP availability may vary between the different SKUs.

With cTDP, the processor is now capable of altering the maximum sustained power with an alternate IA core base frequency. Configurable TDP allows operation in situations where extra cooling is available or situations where a cooler and quieter mode of operation is desired. Configurable TDP can be enabled using Intel's DPTF driver or through HW/EC firmware. Enabling cTDP using the DPTF driver is recommended as Intel does not provide specific application or EC source code.

cTDP consists of three modes as shown in the following table.

Table 21. Configurable TDP Modes

Mode	Description
Base	The average power dissipation and junction temperature operating condition limit for which the processor is validated during manufacturing when executing an associated Intel-specified high-complexity workload at the processor IA core frequency corresponding to the configuration and SKU.
TDP-Up	The SKU-specific processor IA core frequency where manufacturing confirms logical functionality within the set of operating condition limits specified for the SKU segment and Configurable TDP-Up configuration. The Configurable TDP-Up Frequency and corresponding TDP is higher than the processor IA core Base Frequency and SKU Segment Base TDP.
TDP-Down	The processor IA core frequency where manufacturing confirms logical functionality within the set of operating condition limits specified for the SKU segment and Configurable TDP-Down configuration. The Configurable TDP-Down Frequency and corresponding TDP is lower than the processor IA core Base Frequency and SKU Segment Base TDP.

In each mode, the Intel Turbo Boost Technology 2.0 power and frequency ranges are reprogrammed and the OS is given a new effective HFM operating point. The driver assists in all these operations. The cTDP mode does not change the max per-core turbo frequency.

5.4.2 Low-Power Mode

Low-Power Mode (LPM) can provide cooler and quieter system operation. By combining several active power limiting techniques, the processor can consume less power while running at equivalent low frequencies. Active power is defined as processor power consumed while a workload is running and does not refer to the power consumed during idle modes of operation. LPM is only available using the Intel DPTF driver.

Through the DPTF driver, LPM can be configured to use each of the following methods to reduce active power:

- Restricting Intel Turbo Boost Power limits and IA core Turbo Boost availability
- Off-Lining core activity (Move processor traffic to a subset of cores)
- Placing an IA Core at LFM or LSF (Lowest Supported Frequency)
- Utilizing IA clock modulation
- Reducing number of active EUs to GT2 equivalent (Applicable for GT3 SKUs Only)
- LPM power as listed in the *TDP Specifications* table is defined at a point which IA cores are working at MFM, GT = RPN and 1 core active

Off-lining core activity is the ability to dynamically scale a workload to a limited subset of cores in conjunction with a lower turbo power limit. It is one of the main vectors available to reduce active power. However, not all processor activity is ensured to be able to shift to a subset of cores. Shifting a workload to a limited subset of cores allows other cores to remain idle and save power. Therefore, when LPM is enabled, less power is consumed at equivalent frequencies.

Minimum Frequency Mode (MFM) of operation, which is the lowest supported frequency (LSF) at the LFM voltage, has been made available for use under LPM for further reduction in active power beyond LFM capability to enable cooler and quieter modes of operation.

5.5 Thermal and Power Specifications

The following notes apply to [Table 22](#) on page 73 through [Table 24](#) on page 73.

Note	Definition
1	The TDP and Configurable TDP values are the average power dissipation in junction temperature operating condition limit, for the SKU Segment and Configuration, for which the processor is validated during manufacturing when executing an associated Intel-specified high-complexity workload at the processor IA core frequency corresponding to the configuration and SKU.
2	TDP workload may consist of a combination of processor-core intensive and graphics-core intensive applications.
3	The thermal solution needs to ensure that the processor temperature does not exceed the maximum junction temperature (T_{jMAX}) limit, as measured by the DTS and the critical temperature bit.
4	The processor junction temperature is monitored by Digital Temperature Sensors (DTS). For DTS accuracy, refer to Digital Thermal Sensor Accuracy (Taccuracy) on page 76.
5	N/A
6	The idle power specifications are not 100% tested. These power specifications are determined by the characterization at higher temperatures and extrapolating the values for the junction temperature indicated.
7	At T_j of T_{jMAX}
8	At T_j of 50 °C
9	At T_j of 35 °C
10	Can be modified at runtime by MSR writes, with MMIO and with PECI commands.
11	'Turbo Time Parameter' is a mathematical parameter (unit in seconds) that controls the processor turbo algorithm using a moving average of energy usage. Do not set the Turbo Time Parameter to a value less than 0.1 seconds. Refer to Turbo Time Parameter on page 70 for further information.
12	Shown limit is a time averaged power, based upon the Turbo Time Parameter. Absolute product power may exceed the set limits for short durations or under virus or uncharacterized workloads.
13	Processor will be controlled to specified power limit as described in Intel Turbo Boost Technology 2.0 Power Monitoring on page 69. If the power value and/or 'Turbo Time Parameter' is changed during runtime, it may take a short period of time (approximately 3 to 5 times the 'Turbo Time Parameter') for the algorithm to settle at the new control limits.
14	This is a hardware default setting and not a behavioral characteristic of the part.
15	For controllable turbo workloads, limit may be exceeded for up to 10 ms.
16	Refer to Table 22 on page 73 for the definitions of 'TDP-Nominal', 'TDP-Up', 'TDP-Down'.
17	LPM power level is an opportunistic power and is not a guaranteed value as usages and implementations may vary.
continued...	

Note	Definition
18	Power limits may vary depending on if the product supports the 'TDP-up' and/or 'TDP-down' modes. Default power limits can be found in the PKG_PWR_SKU MSR (614h).
19	May vary based on SKU.
20	Hardware default values might be overridden by the BIOS. Refer to the BIOS Reference code for more information.

Table 22. Thermal Design Power (TDP) Specifications

Segment	Processor IA Cores, Graphics Config, and TDP	Configuration	Processor IA Core Frequency	Graphics Core Frequency	Thermal Design Power (TDP) [W]	Notes
Intel® Core™ H-Processor Line BGA 1364	Quad Core GT3 47W with OPC	Base	800 MHz to 2.9 GHz	300 MHz to 1.15 GHz	47	1, 2, 6, 7, 16, 17, 18
		LPM	800 MHz	300 MHz		
	Dual Core GT3 47W with OPC	Base	800 MHz to 3.1 GHz	300 MHz to 1.05 GHz	47	1, 2, 6, 7, 16, 17, 18
		Configurable TDP-Down	2.2 GHz	300 MHz		
		LPM	800 MHz	300 MHz		
	Quad Core GT2 47W	Base	800 MHz to 2.7 GHz	300 MHz to 1.05 GHz	47	1, 2, 6, 7, 16, 17, 18
		Configurable TDP-Down	2.4 GHz	300 MHz		
		LPM	800 MHz	300 MHz		

Table 23. Junction Temperature Specification

Segment	Symbol	Package Turbo Parameter	Min	Default	Max	Units	Notes
Intel® Core™ H-Processor Line BGA 1364	T _j	Junction temperature limit	0	—	105	°C	3, 4

Table 24. Idle Power Specifications

Segment	Processor IA Cores, Graphics Config, and TDP	Symbol	Idle Parameter	Min	Typ	Max	Units	Notes
Intel® Core™ H-Processor Line BGA 1364	Quad Core GT3 47W	P _{C6}	Idle power in the Package C6 state	0	—	2.5	W	6, 8
	Quad Core GT2 47W	P _{C6}	Idle power in the Package C6 state	0	—	2.5	W	6, 8
	Dual Core GT2 47W	P _{C6}	Idle power in the Package C6 state	0	—	2.5	W	6, 8

5.6 Thermal Management Features

Occasionally the processor may operate in conditions that are near to its maximum operating temperature. This can be due to internal overheating or overheating within the platform. To protect the processor and the platform from thermal failure, several

thermal management features exist to reduce package power consumption and thereby temperature in order to remain within normal operating limits. Furthermore, the processor supports several methods to reduce memory power.

5.6.1 Adaptive Thermal Monitor

The purpose of the Adaptive Thermal Monitor is to reduce processor core power consumption and temperature until it operates at or below its maximum operating temperature. Processor core power reduction is achieved by:

- Adjusting the operating frequency (using the core ratio multiplier) and voltage.
- Modulating (starting and stopping) the internal processor core clocks (duty cycle).

The Adaptive Thermal Monitor can be activated when the package temperature, monitored by any digital thermal sensor (DTS) meets or exceeds its maximum operating temperature. The maximum operating temperature implies either maximum junction temperature T_{jMAX} , or T_{jMAX} minus TCC Activation offset.

Exceeding the maximum operating temperature activates the thermal control circuit (TCC), if enabled. When activated, the thermal control circuit (TCC) causes both the processor core and graphics core to reduce frequency and voltage adaptively. The Adaptive Thermal Monitor will remain active as long as the package temperature exceeds its specified limit. Therefore, the Adaptive Thermal Monitor will continue to reduce the package frequency and voltage until the TCC is de-activated.

T_{jMAX} is factory calibrated and is not user configurable. The default value is software visible in the `TEMPERATURE_TARGET` (0x1A2) MSR, bits [23:16]. The `TEMPERATURE_TARGET` value stays the same when TCC Activation offset is enabled.

The Adaptive Thermal Monitor does not require any additional hardware, software drivers, or interrupt handling routines. It is not intended as a mechanism to maintain processor TDP. The system design should provide a thermal solution that can maintain TDP within its intended usage range.

Note: Adaptive Thermal Monitor protection is always enabled.

5.6.1.1 Thermal Control Circuit (TCC) Activation Offset

TCC Activation Offset can be used to activate the Adaptive Thermal Monitor at temperatures lower than T_{jMAX} . It is the preferred thermal protection mechanism for Intel Turbo Boost Technology 2.0 operation since ACPI passive throttling states will pull the processor out of turbo mode operation when triggered. An offset (in degrees Celsius) can be written to the `TEMPERATURE_TARGET` (0x1A2) MSR, bits [27:24]. This value will be subtracted from the value found in bits [23:16]. The default offset is 0 °C, TCC activation will occur at T_{jMAX} . The offset should be set lower than any other protection such as ACPI `_PSV` trip points.

5.6.1.2 Frequency / Voltage Control

Upon Adaptive Thermal Monitor activation, the processor core attempts to dynamically reduce processor core power by lowering the frequency and voltage operating point. The operating points are automatically calculated by the processor core itself and do not require the BIOS to program them as with previous generations of Intel processors. The processor core will scale the operating points such that:

- The voltage will be optimized according to the temperature, the core bus ratio, and number of cores in deep C-states.
- The core power and temperature are reduced while minimizing performance degradation.

Once the temperature has dropped below the maximum operating temperature, the operating frequency and voltage will transition back to the normal system operating point.

Once a target frequency/bus ratio is resolved, the processor core will transition to the new target automatically.

- On an upward operating point transition, the voltage transition precedes the frequency transition.
- On a downward transition, the frequency transition precedes the voltage transition.
- The processor continues to execute instructions. However, the processor will halt instruction execution for frequency transitions.

If a processor load-based Enhanced Intel SpeedStep Technology/P-state transition (through MSR write) is initiated while the Adaptive Thermal Monitor is active, there are two possible outcomes:

- If the P-state target frequency is higher than the processor core optimized target frequency, the P-state transition will be deferred until the thermal event has been completed.
- If the P-state target frequency is lower than the processor core optimized target frequency, the processor will transition to the P-state operating point.

5.6.1.3 Clock Modulation

If the frequency/voltage changes are unable to end an Adaptive Thermal Monitor event, the Adaptive Thermal Monitor will utilize clock modulation. Clock modulation is done by alternately turning the clocks off and on at a duty cycle (ratio between clock "on" time and total time) specific to the processor. The duty cycle is factory configured to 25% on and 75% off and cannot be modified. The period of the duty cycle is configured to 32 microseconds when the Adaptive Thermal Monitor is active. Cycle times are independent of processor frequency. A small amount of hysteresis has been included to prevent excessive clock modulation when the processor temperature is near its maximum operating temperature. Once the temperature has dropped below the maximum operating temperature and the hysteresis timer has expired, the Adaptive Thermal Monitor goes inactive and clock modulation ceases. Clock modulation is automatically engaged as part of the Adaptive Thermal Monitor activation when the frequency/voltage targets are at their minimum settings. Processor performance will be decreased by the same amount as the duty cycle when clock modulation is active. Snooping and interrupt processing are performed in the normal manner while the Adaptive Thermal Monitor is active.

5.6.2 Digital Thermal Sensor

Each processor execution core has an on-die Digital Thermal Sensor (DTS) that detects the core's instantaneous temperature. The DTS is the preferred method of monitoring processor die temperature because:

- It is located near the hottest portions of the die.

- It can accurately track the die temperature and ensure that the Adaptive Thermal Monitor is not excessively activated.

Temperature values from the DTS can be retrieved through:

- A software interface using processor Model Specific Register (MSR).
- A processor hardware interface as described in [Platform Environmental Control Interface \(PECI\)](#) on page 38.

When temperature is retrieved by the processor MSR, it is the instantaneous temperature of the given core. When temperature is retrieved using PECI, it is the average of the highest DTS temperature in the package over a 256 ms time window. Intel recommends using the PECI reported temperature for platform thermal control that benefits from averaging, such as fan speed control. The average DTS temperature may not be a good indicator of package Adaptive Thermal Monitor activation or rapid increases in temperature that triggers the Out of Specification status bit within the PACKAGE_THERM_STATUS MSR 1B1h and IA32_THERM_STATUS MSR 19Ch.

Code execution is halted in C1 or deeper C-states. Package temperature can still be monitored through PECI in lower C-states.

Unlike traditional thermal devices, the DTS outputs a temperature relative to the maximum supported operating temperature of the processor (T_{jMAX}), regardless of TCC activation offset. It is the responsibility of software to convert the relative temperature to an absolute temperature. The absolute reference temperature is readable in the TEMPERATURE_TARGET MSR 1A2h. The temperature returned by the DTS is an implied negative integer indicating the relative offset from T_{jMAX} . The DTS does not report temperatures greater than T_{jMAX} . The DTS-relative temperature readout directly impacts the Adaptive Thermal Monitor trigger point. When a package DTS indicates that it has reached the TCC activation (a reading of 0h, except when the TCC activation offset is changed), the TCC will activate and indicate an Adaptive Thermal Monitor event. A TCC activation will lower both IA core and graphics core frequency, voltage, or both. Changes to the temperature can be detected using two programmable thresholds located in the processor thermal MSRs. These thresholds have the capability of generating interrupts using the core's local APIC. Refer to the *Intel® 64 and IA-32 Architectures Software Developer's Manual* for specific register and programming details.

5.6.2.1 Digital Thermal Sensor Accuracy (Taccuracy)

The error associated with DTS measurements will not exceed ± 5 °C within the entire operating range.

5.6.2.2 Fan Speed Control with Digital Thermal Sensor

Digital Thermal Sensor based fan speed control (T_{FAN}) is a recommended feature to achieve optimal thermal performance. At the T_{FAN} temperature, Intel recommends full cooling capability well before the DTS reading reaches T_{jMAX} .

5.6.3 PROCHOT# Signal

PROCHOT# (processor hot) is asserted when the processor temperature has reached its maximum operating temperature (T_{jMAX}). Only a single PROCHOT# pin exists at a package level. When any core arrives at the TCC activation point, the PROCHOT# signal will be asserted. PROCHOT# assertion policies are independent of Adaptive Thermal Monitor enabling.

5.6.3.1 Bi-Directional PROCHOT#

By default, the PROCHOT# signal is set to bi-directional. However, it is recommended to configure the signal as an input only. When configured as an input or bi-directional signal, PROCHOT# can be used for thermally protecting other platform components in case the components overheat as well. When PROCHOT# is driven by an external device:

- The package will immediately transition to the lowest P-State (P_n) supported by the processor and graphics cores. This is contrary to the internally-generated Adaptive Thermal Monitor response.
- Clock modulation is not activated.

The processor package will remain at the lowest supported P-state until the system de-asserts PROCHOT#. The processor can be configured to generate an interrupt upon assertion and de-assertion of the PROCHOT# signal.

Note: When PROCHOT# is configured as a bi-directional signal and PROCHOT# is asserted by the processor, it is impossible for the processor to detect a system assertion of PROCHOT#. The system assertion will have to wait until the processor de-asserts PROCHOT# before PROCHOT# action can occur due to the system assertion. While the processor is hot and asserting PROCHOT#, the power is reduced; however, the reduction rate is slower than the system PROCHOT# response of < 100 us. The processor thermal control is staged in smaller increments over many milliseconds. This may cause several milliseconds of delay to a system assertion of PROCHOT# while the output function is asserted.

5.6.3.2 Voltage Regulator Protection using PROCHOT#

PROCHOT# may be used for thermal protection of voltage regulators (VR). System designers can create a circuit to monitor the VR temperature and assert PROCHOT# and, if enabled, activate the TCC when the temperature limit of the VR is reached. When PROCHOT# is configured as a bi-directional or input only signal, if the system assertion of PROCHOT# is recognized by the processor, it will result in an immediate transition to the lowest P-State (P_n) supported by the processor and graphics cores. Systems should still provide proper cooling for the VR and rely on bi-directional PROCHOT# only as a backup in case of system cooling failure. Overall, the system thermal design should allow the power delivery circuitry to operate within its temperature specification even while the processor is operating at its TDP.

5.6.3.3 Thermal Solution Design and PROCHOT# Behavior

With a properly designed and characterized thermal solution, it is anticipated that PROCHOT# will only be asserted for very short periods of time when running the most power intensive applications. The processor performance impact due to these brief

periods of TCC activation is expected to be so minor that it would be immeasurable. However, an under-designed thermal solution that is not able to prevent excessive assertion of PROCHOT# in the anticipated ambient environment may:

- Cause a noticeable performance loss.
- Result in prolonged operation at or above the specified maximum junction temperature and affect the long-term reliability of the processor.
- May be incapable of cooling the processor even when the TCC is active continuously (in extreme situations).

5.6.3.4 Low-Power States and PROCHOT# Behavior

Depending on package power levels during package C-states, outbound PROCHOT# may de-assert while the processor is idle as power is removed from the signal. Upon wakeup, if the processor is still hot, the PROCHOT# will re-assert, although typically package idle state residency should resolve any thermal issues. The PECCI interface is fully operational during all C-states and it is expected that the platform continues to manage processor core and package thermals even during idle states by regularly polling for thermal data over PECCI.

5.6.3.5 THERMTRIP# Signal

Regardless of enabling the automatic or on-demand modes, in the event of a catastrophic cooling failure, the package will automatically shut down when the silicon has reached an elevated temperature that risks physical damage to the product. At this point the THERMTRIP# signal will go active.

5.6.3.6 Critical Temperature Detection

Critical Temperature detection is performed by monitoring the package temperature. This feature is intended for graceful shutdown before the THERMTRIP# is activated. However, the processor execution is not guaranteed between critical temperature and THERMTRIP#. If the Adaptive Thermal Monitor is triggered and the temperature remains high, a critical temperature status and sticky bit are latched in the PACKAGE_THERM_STATUS MSR 1B1h and the condition also generates a thermal interrupt, if enabled. For more details on the interrupt mechanism, refer to the *Intel® 64 and IA-32 Architectures Software Developer's Manual*.

5.6.4 On-Demand Mode

The processor provides an auxiliary mechanism that allows system software to force the processor to reduce its power consumption using clock modulation. This mechanism is referred to as "On-Demand" mode and is distinct from Adaptive Thermal Monitor and bi-directional PROCHOT#. The processor platforms must not rely on software usage of this mechanism to limit the processor temperature. On-Demand Mode can be accomplished using processor MSR or chipset I/O emulation. On-Demand Mode may be used in conjunction with the Adaptive Thermal Monitor. However, if the system software tries to enable On-Demand mode at the same time the TCC is engaged, the factory configured duty cycle of the TCC will override the duty cycle selected by the On-Demand mode. If the I/O-based and MSR-based On-Demand modes are in conflict, the duty cycle selected by the I/O emulation-based On-Demand mode will take precedence over the MSR-based On-Demand Mode.

5.6.4.1 MSR Based On-Demand Mode

If Bit 4 of the IA32_CLOCK_MODULATION MSR is set to a 1, the processor will immediately reduce its power consumption using modulation of the internal core clock, independent of the processor temperature. The duty cycle of the clock modulation is programmable using bits [3:1] of the same IA32_CLOCK_MODULATION MSR. In this mode, the duty cycle can be programmed in either 12.5% or 6.25% increments (discoverable using CPUID). Thermal throttling using this method will modulate each processor core's clock independently.

5.6.4.2 I/O Emulation-Based On-Demand Mode

I/O emulation-based clock modulation provides legacy support for operating system software that initiates clock modulation through I/O writes to ACPI defined processor clock control registers on the chipset (PROC_CNT). Thermal throttling using this method will modulate all processor cores simultaneously.

5.6.5 Intel® Memory Thermal Management

The processor provides thermal protection for system memory by throttling memory traffic when using either DIMM modules or a memory down implementation. Two levels of throttling are supported by the processor – either a warm threshold or hot threshold that is customizable through memory mapped I/O registers. Throttling based on the warm threshold should be an intermediate level of throttling. Throttling based on the hot threshold should be the most severe. The amount of throttling is dynamically controlled by the processor.

Memory temperature can be acquired through an on-board thermal sensor (TS-on-Board), retrieved by an embedded controller and reported to the processor through the PECCI 3.0 interface. This methodology is known as PECCI injected temperatures and is a method of Closed Loop Thermal Management (CLTM). CLTM requires the use of a physical thermal sensor. EXTTS# is another method of CLTM; however, it is only capable of reporting memory thermal status to the processor. EXTTS# consists of two GPIO pins on the PCH where the state of the pins is communicated internally to the processor.

When a physical thermal sensor is not available to report temperature, the processor supports Open Loop Thermal Management (OLTM) that estimates the power consumed per rank of the memory using the processor DRAM power meter. A per rank power is associated with the warm and hot thresholds that, when exceeded, may trigger memory thermal throttling.

6.0 Signal Description

This chapter describes the processor signals. The signals are arranged in functional groups according to the associated interface or category. The following notations are used to describe the signal type.

Notation	Signal Type
I	Input pin
O	Output pin
I/O	Bi-directional Input/Output pin

The signal description also includes the type of buffer used for the particular signal (see the following table).

Table 25. Signal Description Buffer Types

Signal	Description
PCI Express*	PCI Express* interface signals. These signals are compatible with PCI Express 3.0 Signaling Environment AC Specifications and are AC coupled. The buffers are not 3.3 V- tolerant. See the <i>PCI Express Base Specification 3.0</i> .
eDP	Embedded Display Port interface signals. These signals are compatible with VESA Rev 1.3 eDP specifications and the interface is AC coupled. The buffers are not 3.3V- tolerant.
FDI	Intel Flexible Display interface signals. These signals are based on PCI Express 2.0 Signaling Environment AC Specifications (2.7 GT/s), but are DC coupled. The buffers are not 3.3 V- tolerant.
DMI	Direct Media Interface signals. These signals are compatible with PCI Express 2.0 Signaling Environment AC Specifications, but are DC coupled. The buffers are not 3.3 V- tolerant.
CMOS	CMOS buffers. 1.05V- tolerant
DDR3L/DDR3L-RS	DDR3L/DDR3L-RS buffers: 1.35 V- tolerant
A	Analog reference or output. May be used as a threshold voltage or for buffer compensation
GTL	Gunning Transceiver Logic signaling technology
Ref	Voltage reference signal
Asynchronous ¹	Signal has no timing relationship with any reference clock.
1. Qualifier for a buffer type.	

6.1 System Memory Interface Signals

Table 26. Memory Channel A Signals

Signal Name	Description	Direction / Buffer Type
SA_BS[2:0]	Bank Select: These signals define which banks are selected within each SDRAM rank.	O DDR3L /DDR3L-RS
SA_WE#	Write Enable Control Signal: This signal is used with SA_RAS# and SA_CAS# (along with SA_CS#) to define the SDRAM Commands.	O DDR3L /DDR3L-RS
SA_RAS#	RAS Control Signal: This signal is used with SA_CAS# and SA_WE# (along with SA_CS#) to define the SRAM Commands.	O DDR3L /DDR3L-RS
SA_CAS#	CAS Control Signal: This signal is used with SA_RAS# and SA_WE# (along with SA_CS#) to define the SRAM Commands.	O DDR3L /DDR3L-RS
SA_DQSP[7:0] SA_DQSN[7:0]	Data Strobes: SA_DQS[7:0] and its complement signal group make up a differential strobe pair. The data is captured at the crossing point of SA_DQS[7:0] and SA_DQS#[7:0] during read and write transactions.	I/O DDR3L/DDR3L-RS
SA_DQ[63:0]	Data Bus: Channel A data signal interface to the SDRAM data bus.	I/O DDR3L /DDR3L-RS
SA_MA[15:0]	Memory Address: These signals are used to provide the multiplexed row and column address to the SDRAM.	O DDR3L /DDR3L-RS
SA_CKP[3:0] SA_CKN[3:0]	SDRAM Differential Clock: These signals are Channel A SDRAM Differential clock signal pairs. The crossing of the positive edge of SA_CKP and the negative edge of its complement SA_CKN are used to sample the command and control signals on the SDRAM. Bits [3:2] are used only for 2 DPC system.	O DDR3L/DDR3L-RS
SA_CKE[3:0]	Clock Enable: (1 per rank). These signals are used to: <ul style="list-style-type: none"> Initialize the SDRAMs during power-up Power-down SDRAM ranks Place all SDRAM ranks into and out of self-refresh during STR Bits [3:2] used only for 2 DPC system	O DDR3L/DDR3L-RS
SA_CS#[3:0]	Chip Select: (1 per rank). These signals are used to select particular SDRAM components during the active state. There is one Chip Select for each SDRAM rank. Bits [3:2] are used only for 2 DPC system.	O DDR3L/DDR3L-RS
SA_ODT[3:0]	On Die Termination: Active Termination Control. Bits [3:2] are used only for 2 DPC system.	O DDR3L/DDR3L-RS

Table 27. Memory Channel B Signals

Signal Name	Description	Direction / Buffer Type
SB_BS[2:0]	Bank Select: These signals define which banks are selected within each SDRAM rank.	O DDR3L /DDR3L-RS
SB_WE#	Write Enable Control Signal: This signal is used with SB_RAS# and SB_CAS# (along with SB_CS#) to define the SDRAM Commands.	O DDR3L /DDR3L-RS
SB_RAS#	RAS Control Signal: This signal is used with SB_CAS# and SB_WE# (along with SB_CS#) to define the SRAM Commands.	O DDR3L /DDR3L-RS
SB_CAS#	CAS Control Signal: This signal is used with SB_RAS# and SB_WE# (along with SB_CS#) to define the SRAM Commands.	O DDR3L /DDR3L-RS
SB_DQSP[7:0] SB_DQSN[7:0]	Data Strobes: SB_DQS[7:0] and its complement signal group make up a differential strobe pair. The data is captured at the crossing point of SB_DQS[8:0] and its SB_DQS#[7:0] during read and write transactions.	I/O DDR3L/DDR3L-RS
SB_DQ[63:0]	Data Bus: Channel B data signal interface to the SDRAM data bus.	I/O DDR3L /DDR3L-RS
SB_MA[15:0]	Memory Address: These signals are used to provide the multiplexed row and column address to the SDRAM.	O DDR3L /DDR3L-RS
SB_CKP[3:0] SB_CKN[3:0]	SDRAM Differential Clock: Channel B SDRAM Differential clock signal pair. The crossing of the positive edge of SB_CKP and the negative edge of its complement SB_CKN are used to sample the command and control signals on the SDRAM. Bits [3:2] used only for 2 DPC system.	O DDR3L/DDR3L-RS
SB_CKE[3:0]	Clock Enable: (1 per rank). These signals are used to: <ul style="list-style-type: none"> Initialize the SDRAMs during power-up. Power-down SDRAM ranks. Place all SDRAM ranks into and out of self-refresh during STR. Bits [3:2] used only for 2 DPC system 	O DDR3L/DDR3L-RS
SB_CS#[3:0]	Chip Select: (1 per rank). These signals are used to select particular SDRAM components during the active state. There is one Chip Select for each SDRAM rank. Bits [3:2] are used only for 2 DPC system.	O DDR3L/DDR3L-RS
SB_ODT[3:0]	On Die Termination: Active Termination Control. Signals [3:2] are used only for 2 DPC system.	O DDR3L/DDR3L-RS

6.2 Memory Reference and Compensation Signals

Table 28. Memory Reference and Compensation Signals

Signal Name	Description	Direction / Buffer Type
SM_RCOMP[2:0]	System Memory Impedance Compensation:	I A
SM_VREF	DDR3L Reference Voltage: This signal is used as a reference voltage to the DDR3L/DDR3L-RS controller and is defined as $V_{DDQ}/2$.	O DDR3L/DDR3L-RS
SA_DIMM_VREFDQ SB_DIMM_VREFDQ	Memory Channel A/B DIMM DQ Voltage Reference: The output pins are connected to the DIMMs, and holds $V_{DDQ}/2$ as reference voltage.	O DDR3L /DDR3L-RS

6.3 Reset and Miscellaneous Signals

Table 29. Reset and Miscellaneous Signals

Signal Name	Description	Direction / Buffer Type
CFG[19:0]	<p>Configuration Signals: The CFG signals have a default value of '1' if not terminated on the board.</p> <ul style="list-style-type: none"> • CFG[1:0]: Reserved configuration lane. A test point may be placed on the board for these lanes. • CFG[2]: PCI Express* Static x16 Lane Numbering Reversal. <ul style="list-style-type: none"> — 1 = Normal operation — 0 = Lane numbers reversed. • CFG[3]: MSR Privacy Bit Feature <ul style="list-style-type: none"> — 1 = Debug capability is determined by IA32_Debug_Interface_MSR (C80h) bit[0] setting — 0 = IA32_Debug_Interface_MSR (C80h) bit[0] default setting overridden • CFG[4]: eDP enable <ul style="list-style-type: none"> — 1 = Disabled — 0 = Enabled • CFG[6:5]: PCI Express* Bifurcation: <ul style="list-style-type: none"> — 00 = 1 x8, 2 x4 PCI Express* — 01 = reserved — 10 = 2 x8 PCI Express* — 11 = 1 x16 PCI Express* • CFG[19:7]: Reserved configuration lanes. A test point may be placed on the board for these lands. 	I/O GTL
CFG_RCOMP	Configuration resistance compensation. Use a 49.9 Ω \pm 1% resistor to ground.	—
FC_x	FC (Future Compatibility) signals are signals that are available for compatibility with other processors. A test point may be placed on the board for these lands.	—
PM_SYNC	Power Management Sync: A sideband signal to communicate power management status from the platform to the processor.	I CMOS
PWR_DEBUG#	Signal is for debug.	I Asynchronous CMOS
<i>continued...</i>		

Signal Name	Description	Direction / Buffer Type
IST_TRIGGER	Signal is for IFDIM testing only.	I CMOS
IVR_ERROR	Signal is for debug. If both THERMTRIP# and this signal are simultaneously asserted, the processor has encountered an unrecoverable power delivery fault and has engaged automatic shutdown as a result.	O CMOS
RESET#	Platform Reset pin driven by the PCH.	I CMOS
RSVD RSVD_TP RSVD_NCTF	RESERVED: All signals that are RSVD and RSVD_NCTF must be left unconnected on the board. Intel recommends that all RSVD_TP signals have via test points.	No Connect Test Point Non-Critical to Function
SM_DRAMRST#	DRAM Reset: Reset signal from processor to DRAM devices. One signal common to all channels.	O CMOS
TESTLO_x	TESTLO should be individually connected to V _{SS} through a resistor.	—

6.4 PCI Express* Interface Signals

Table 30. PCI Express* Graphics Interface Signals

Signal Name	Description	Direction / Buffer Type
PEG_RCOMP	PCI Express Resistance Compensation	I A
PEG_RXP[15:0] PEG_RXN[15:0]	PCI Express Receive Differential Pair	I PCI Express
PEG_TXP[15:0] PEG_TXN[15:0]	PCI Express Transmit Differential Pair	O PCI Express

6.5 embedded DisplayPort* (eDP*) Signals

Table 31. embedded Display Port* Signals

Signal Name	Description	Direction / Buffer Type
eDP_TXP[1:0] eDP_TXN[1:0]	embedded DisplayPort Transmit Differential Pair	O eDP
eDP_AUXP eDP_AUXN	embedded DisplayPort Auxiliary Differential Pair	O eDP
eDP_HPD	embedded DisplayPort Hot-Plug Detect. The polarity of this signal is active low.	I A
eDP_RCOMP	embedded DisplayPort Current Compensation	I/O A
eDP_DISP_UTIL	Low voltage multipurpose DISP_UTIL pin on the processor for backlight modulation control of embedded panels and S3D device control for active shutter glasses. This pin will co-exist with functionality similar to existing BKLTCTL pin on the PCH.	O Asynchronous CMOS

6.6 Display Interface Signals

Table 32. Display Interface Signals

Signal Name	Description	Direction / Buffer Type
FDI_TXP[1:0] FDI_TXN[1:0]	Intel Flexible Display Interface Transmit Differential Pair	O FDI
DDIB_TXP[3:0] DDIB_TXN[3:0]	Digital Display Interface Transmit Differential Pair	O FDI
DDIC_TXP[3:0] DDIC_TXN[3:0]	Digital Display Interface Transmit Differential Pair	O FDI
DDID_TXP[3:0] DDID_TXN[3:0]	Digital Display Interface Transmit Differential Pair	O FDI
FDI_CSNC	Intel Flexible Display Interface Sync	I CMOS
DISP_INT	Intel Flexible Display Interface Hot-Plug Interrupt	I Asynchronous CMOS

6.7 Direct Media Interface (DMI)

Table 33. Direct Media Interface (DMI) – Processor to PCH Serial Interface

Signal Name	Description	Direction / Buffer Type
DMI_RXP[3:0] DMI_RXN[3:0]	DMI Input from PCH: Direct Media Interface receive differential pair.	I DMI
DMI_TXP[3:0] DMI_TXN[3:0]	DMI Output to PCH: Direct Media Interface transmit differential pair.	O DMI

6.8 Phase Locked Loop (PLL) Signals

Table 34. Phase Locked Loop (PLL) Signals

Signal Name	Description	Direction / Buffer Type
BCLKP BCLKN	Differential bus clock input to the processor	I Diff Clk
DPLL_REF_CLKP DPLL_REF_CLKN	Embedded Display Port PLL Differential Clock In: 135 MHz	I Diff Clk
SSC_DPLL_REF_CLKP SSC_DPLL_REF_CLKN	Spread Spectrum Embedded DisplayPort PLL Differential Clock In: 135 MHz	I Diff Clk

6.9 Testability Signals

Table 35. Testability Signals

Signal Name	Description	Direction / Buffer Type
BPM#[7:0]	Breakpoint and Performance Monitor Signals: Outputs from the processor that indicate the status of breakpoints and programmable counters used for monitoring processor performance.	I/O GTL
DBR#	Debug Reset: This signal is used only in systems where no debug port is implemented on the system board. DBR# is used by a debug port interposer so that an in-target probe can drive system reset.	O
PRDY#	Processor Ready: This signal is a processor output used by debug tools to determine processor debug readiness.	O GTL
PREQ#	Processor Request: This signal is used by debug tools to request debug operation of the processor.	I GTL
TCK	Test Clock: This signal provides the clock input for the processor Test Bus (also known as the Test Access Port). This signal must be driven low or allowed to float during power on Reset.	I GTL
TDI	Test Data In: This signal transfers serial test data into the processor. This signal provides the serial input needed for JTAG specification support.	I GTL
TDO	Test Data Out: This signal transfers serial test data out of the processor. This signal provides the serial output needed for JTAG specification support.	O Open Drain
TMS	Test Mode Select: This is a JTAG specification supported signal used by debug tools.	I GTL
TRST#	Test Reset: This signal resets the Test Access Port (TAP) logic. This signal must be driven low during power on Reset.	I GTL

6.10 Error and Thermal Protection Signals

Table 36. Error and Thermal Protection Signals

Signal Name	Description	Direction / Buffer Type
CATERR#	Catastrophic Error: This signal indicates that the system has experienced a catastrophic error and cannot continue to operate. The processor will set this for non-recoverable machine check errors or other unrecoverable internal errors. CATERR# is used for signaling the following types of errors: Legacy MCERRs, CATERR# is asserted for 16 BCLKs. Legacy IERRs, CATERR# remains asserted until warm or cold reset.	O GTL
PECI	Platform Environment Control Interface: A serial sideband interface to the processor, it is used primarily for thermal, power, and error management.	I/O Asynchronous
PROCHOT#	Processor Hot: PROCHOT# goes active when the processor temperature monitoring sensor(s) detects that the processor has reached its maximum safe operating temperature. This indicates that the processor Thermal Control Circuit (TCC) has been activated, if enabled. This signal can also be driven to the processor to activate the TCC.	GTL Input Open-Drain Output
THERMTRIP#	Thermal Trip: The processor protects itself from catastrophic overheating by use of an internal thermal sensor. This sensor is set well above the normal operating temperature to ensure that there are no false trips. The processor will stop all execution when the junction temperature exceeds approximately 130 °C. This is signaled to the system by the THERMTRIP# pin.	O Asynchronous OD Asynchronous CMOS

6.11 Power Sequencing Signals

Table 37. Power Sequencing Signals

Signal Name	Description	Direction / Buffer Type
SM_DRAMPWROK	SM_DRAMPWROK Processor Input: This signal connects to the PCH DRAMPWROK.	I Asynchronous CMOS
PWRGOOD	The processor requires this input signal to be a clean indication that the V _{CC} and V _{DDQ} power supplies are stable and within specifications. This requirement applies regardless of the S-state of the processor. 'Clean' implies that the signal will remain low (capable of sinking leakage current), without glitches, from the time that the power supplies are turned on until the supplies come within specification. The signal must then transition monotonically to a high state.	I Asynchronous CMOS
PROC_DETECT# (BGA)	PROC_DETECT#: Processor Detect: This signal is pulled down directly (0 Ohms) on the processor package to ground. There is no connection to the processor silicon for this signal. System board designers may use this signal to determine if the processor is present.	—

6.12 Processor Power Signals

Table 38. Processor Power Signals

Signal Name	Description	Direction / Buffer Type
VCC	Processor core power rail.	Ref
VCCIO_OUT	Processor power reference for I/O.	Ref
VDDQ	Processor I/O supply voltage for .	Ref
VCCST	Sustain voltage for the processor in standby modes	Ref
VCOMP_OUT	Processor power reference for PEG/Display RCOMP.	Ref
VCCST_PWRGD	The processor requires this input signal to be a clean indication that the VCCST and VDDQ power supplies are stable and within specifications. This signal must have a valid level during both S0 and S3 power states. 'Clean' implies that the signal will remain low (capable of sinking leakage current), without glitches, from the time that the power supplies are turned on until the supplies come within specification. The signal must then transition monotonically to a high state.	I Asynchronous CMOS
VIDSOUT VIDSCLK VIDALERT#	VIDALERT#, VIDSCLK, and VIDSCLK comprise a three signal serial synchronous interface used to transfer power management information between the processor and the voltage regulator controllers.	Input GTL/ Output Open Drain Output Open Drain Input CMOS

6.13 Sense Signals

Table 39. Sense Signals

Signal Name	Description	Direction / Buffer Type
VCC_SENSE VSS_SENSE	VCC_SENSE and VSS_SENSE provide an isolated, low-impedance connection to the processor input V _{CC} voltage and ground. The signals can be used to sense or measure voltage near the silicon.	O A

6.14 Ground and Non-Critical to Function (NCTF) Signals

Table 40. Ground and Non-Critical to Function (NCTF) Signals

Signal Name	Description	Direction / Buffer Type
VSS	Processor ground node	GND
VSS_NCTF	Non-Critical to Function: These pins are for package mechanical reliability.	—
DAISY_CHAIN_NCTF_[Ball #]	Daisy Chain Non-Critical to Function: These signals are for assessing the connectivity of corner BGA solder joints during manufacturing or reliability testing and are non-critical to the function of the processor. These signals are connected on the processor package as follows: <ul style="list-style-type: none">Package A1 CornerDAISY_CHAIN_NCTF_A4 to DAISY_CHAIN_NCTF_A3	
continued...		

Signal Name	Description	Direction / Buffer Type
	<ul style="list-style-type: none"> DAISY_CHAIN_NCTF_B3 to DAISY_CHAIN_NCTF_C3 DAISY_CHAIN_NCTF_B2 to DAISY_CHAIN_NCTF_C2 DAISY_CHAIN_NCTF_C1 to DAISY_CHAIN_NCTF_D1 Package A54 Corner DAISY_CHAIN_NCTF_A51 to DAISY_CHAIN_NCTF_A52 DAISY_CHAIN_NCTF_B52 to DAISY_CHAIN_NCTF_A53 DAISY_CHAIN_NCTF_B53 to DAISY_CHAIN_NCTF_B54 DAISY_CHAIN_NCTF_C54 to DAISY_CHAIN_NCTF_D54 Package BF1 Corner DAISY_CHAIN_NCTF_BC1 to DAISY_CHAIN_NCTF_BD1 DAISY_CHAIN_NCTF_BE1 to DAISY_CHAIN_NCTF_BE2 DAISY_CHAIN_NCTF_BF2 to DAISY_CHAIN_NCTF_BE3 DAISY_CHAIN_NCTF_BF3 to DAISY_CHAIN_NCTF_BF4 Package BF54 Corner DAISY_CHAIN_NCTF_BF51 to DAISY_CHAIN_NCTF_BF52 DAISY_CHAIN_NCTF_BE52 to DAISY_CHAIN_NCTF_BE53 DAISY_CHAIN_NCTF_BF53 to DAISY_CHAIN_NCTF_BE54 DAISY_CHAIN_NCTF_BD54 to DAISY_CHAIN_NCTF_BC54 	

6.15 Processor Internal Pull-Up / Pull-Down Terminations

Table 41. Processor Internal Pull-Up / Pull-Down Terminations

Signal Name	Pull Up / Pull Down	Rail	Value
BPM[7:0]	Pull Up	VCCIO_TERM	40–60 Ω
PREQ#	Pull Up	VCCIO_TERM	40–60 Ω
TDI	Pull Up	VCCIO_TERM	30–70 Ω
TMS	Pull Up	VCCIO_TERM	30–70 Ω
CFG[17:0]	Pull Up	VCCIO_OUT	5–8 k Ω
CATERR#	Pull Up	VCCIO_TERM	30–70 Ω

7.0 Electrical Specifications

This chapter provides the processor electrical specifications including integrated voltage regulator (VR), V_{CC} Voltage Identification (VID), reserved and unused signals, signal groups, Test Access Points (TAP), and DC specifications.

7.1 Integrated Voltage Regulator

A feature to the processor is the integration of platform voltage regulators into the processor. Due to this integration, the processor has one main voltage rail (V_{CC}) and a voltage rail for the memory interface (V_{DDQ}), compared to six voltage rails on previous processors. The V_{CC} voltage rail will supply the integrated voltage regulators which in turn will regulate to the appropriate voltages for the cores, cache, system agent, and graphics. This integration allows the processor to better control on-die voltages to optimize between performance and power savings. The processor V_{CC} rail will remain a VID-based voltage with a loadline similar to the core voltage rail (also called V_{CC}) in previous processors.

7.2 Power and Ground Pins

The processor has V_{CC} , V_{DDQ} , and V_{SS} (ground) pins for on-chip power distribution. All power pins must be connected to their respective processor power planes; all V_{SS} pins must be connected to the system ground plane. Use of multiple power and ground planes is recommended to reduce I^2R drop. The V_{CC} pins must be supplied with the voltage determined by the processor **S**erial **V**oltage **I**Dentification (SVID) interface. [Table 42](#) on page 91 specifies the voltage level for the various VIDs.

7.3 V_{CC} Voltage Identification (VID)

The processor uses three signals for the serial voltage identification interface to support automatic selection of voltages. The following table specifies the voltage level corresponding to the 8-bit VID value transmitted over serial VID. A '1' in this table refers to a high voltage level and a '0' refers to a low voltage level. If the voltage regulation circuit cannot supply the voltage that is requested, the voltage regulator must disable itself. VID signals are CMOS push/pull drivers. See the *Voltage and Current Specifications* section for the DC specifications for these signals. The VID codes will change due to temperature and/or current load changes to minimize the power of the part. A voltage range is provided in the *Voltage and Current Specifications* section. The specifications are set so that one voltage regulator can operate with all supported frequencies.

Individual processor VID values may be set during manufacturing so that two devices at the same core frequency may have different default VID settings. This is shown in the VID range values in the *Voltage and Current Specifications* section. The processor provides the ability to operate while transitioning to an adjacent VID and its associated voltage. This will represent a DC shift in the loadline.

**Table 42. Voltage Regulator (VR) 12.5 Voltage Identification**

7.4 Reserved or Unused Signals

The following are the general types of reserved (RSVD) signals and connection guidelines:

- RSVD – these signals should not be connected
- RSVD_TP – these signals should be routed to a test point
- RSVD_NCTF – these signals are non-critical to function and may be left unconnected

Arbitrary connection of these signals to VCC, VDDQ, VSS, or to any other signal (including each other) may result in component malfunction or incompatibility with future processors. See [Signal Description](#) on page 80 for a pin listing of the processor and the location of all reserved signals.

For reliable operation, always connect unused inputs or bi-directional signals to an appropriate signal level. Unused active high inputs should be connected through a resistor to ground (VSS). Unused outputs may be left unconnected; however, this may interfere with some Test Access Port (TAP) functions, complicate debug probing, and prevent boundary scan testing. A resistor must be used when tying bi-directional signals to power or ground. When tying any signal to power or ground, a resistor will also allow for system testability.

7.5 Signal Groups

Signals are grouped by buffer type and similar characteristics as listed in the following table. The buffer type indicates which signaling technology and specifications apply to the signals. All the differential signals and selected DDR3L and Control Sideband signals have On-Die Termination (ODT) resistors. Some signals do not have ODT and need to be terminated on the board.

Note: All Control Sideband Asynchronous signals are required to be asserted/de-asserted for at least 10 BCLKs with maximum Trise/Tfall of 6 ns for the processor to recognize the proper signal state. See the DC Specifications section and AC Specifications section.

Table 43. Signal Groups

Signal Group	Type	Signals
System Reference Clock		
Differential	CMOS Input	BCLKP, BCLKN, DPLL_REF_CLKP, DPLL_REF_CLKN, SSC_DPLL_REF_CLKP, SSC_DPLL_REF_CLKN
DDR3L / DDR3L-RS Reference Clocks ²		
Differential	DDR3L/DDR3L-RS Output	SA_CKP[3:0], SA_CKN[3:0], SB_CKP[3:0], SB_CKN[3:0]
DDR3L / DDR3L-RS Command Signals ²		
Single ended	DDR3L/DDR3L-RS Output	SA_BS[2:0], SB_BS[2:0], SA_WE#, SB_WE#, SA_RAS#, SB_RAS#, SA_CAS#, SB_CAS#, SA_MA[15:0], SB_MA[15:0]
DDR3L / DDR3L-RS Control Signals ²		
Single ended	DDR3L/DDR3L-RS Output	SA_CKE[3:0], SB_CKE[3:0], SA_CS#[3:0], SB_CS#[3:0], SA_ODT[3:0], SB_ODT[3:0]
Single ended	CMOS Output	SM_DRAMRST#
<i>continued...</i>		

Signal Group	Type	Signals
DDR3L / DDR3L-RS Data Signals ²		
Single ended	DDR3L/DDR3L-RS Bi-directional	SA_DQ[63:0], SB_DQ[63:0]
Differential	DDR3L/DDR3L-RS Bi-directional	SA_DQSP[7:0], SA_DQSN[7:0], SB_DQSP[7:0], SB_DQSN[7:0]
DDR3L / DDR3L-RS Compensation		
	Analog Input	SM_RCOMP[2:0]
DDR3L / DDR3L-RS Reference Voltage Signals		
	DDR3L/DDR3L-RS Output	SM_VREF, SA_DIMM_VREFDQ, SB_DIMM_VREFDQ
Testability (ITP/XDP)		
Single ended	CMOS Input	TCK, TDI, TMS, TRST#
Single ended	GTL	TDO
Single ended	Output	DBR#
Single ended	GTL	BPM#[7:0]
Single ended	GTL	PREQ#
Single ended	GTL	PRDY#
Control Sideband		
Single ended	GTL Input/Open Drain Output	PROCHOT#
Single ended	Asynchronous CMOS Output	THERMTRIP#, IVR_ERROR
Single ended	GTL	CATERR#
Single ended	Asynchronous CMOS Input	PM_SYNC, RESET#, PWRGOOD, PWR_DEBUG#
Single ended	Asynchronous Bi-directional	PECI
Single ended	GTL Bi-directional	CFG[19:0]
Single ended	Analog Input	SM_RCOMP[2:0]
Voltage Regulator		
Single ended	CMOS Input	VR_READY
Single ended	CMOS Input	VIDALERT#
Single ended	Open Drain Output	VIDSCLK
Single ended	GTL Input/Open Drain Output	VIDSOUT
Differential	Analog Output	VCC_SENSE, VSS_SENSE
Power / Ground / Other		
Single ended	Power	VCC, VDDQ, VCCST
	Ground	VSS, VSS_NCTF ³
	No Connect	RSVD, RSVD_NCTF
continued...		

Signal Group	Type	Signals
	Test Point	RSVD_TP
	Other	PROC_DETECT#3
PCI Express* Graphics		
Differential	PCI Express Input	PEG_RXP[15:0], PEG_RXN[15:0]
Differential	PCI Express Output	PEG_TXP[15:0], PEG_TXN[15:0]
Single ended	Analog Input	PEG_RCOMP
Embedded DisplayPort*		
Differential	eDP Output	eDP_TXP[3:0], eDP_TXN[3:0]
Single ended	Asynchronous CMOS Input	eDP_HPD
Single ended	Analog Input/Output	eDP_RCOMP
Digital Media Interface (DMI)		
Differential	DMI Input	DMI_RXP[3:0], DMI_RXN[3:0]
Differential	DMI Output	DMI_TXP[3:0], DMI_TXN[3:0]
Digital Display Interface		
Differential	DDI Output	DDIB_TXP[3:0], DDIB_TXN[3:0], DDIC_TXP[3:0], DDIC_TXN[3:0], DDID_TXP[3:0], DDID_TXN[3:0]
Intel® FDI		
Single ended	CMOS Input	FDI_CSYN
Single ended	Asynchronous CMOS Input	DISP_INT
Differential	FDI Output	FDI_TXP[1:0], FDI_TXN[1:0]
<i>Notes:</i> 1. See Signal Description on page 80 for signal description details. 2. SA and SB refer to DDR3L/DDR3L-RS Channel A and DDR3L/DDR3L-RS Channel B. 3. These signals only apply to BGA packages.		

7.6 Test Access Port (TAP) Connection

Due to the voltage levels supported by other components in the Test Access Port (TAP) logic, Intel recommends the processor be first in the TAP chain, followed by any other components within the system. A translation buffer should be used to connect to the rest of the chain unless one of the other components is capable of accepting an input of the appropriate voltage. Two copies of each signal may be required with each driving a different voltage level.

The processor supports Boundary Scan (JTAG) IEEE 1149.1-2001 and IEEE 1149.6-2003 standards. A few of the I/O pins may support only one of those standards.

7.7 DC Specifications

The processor DC specifications in this section are defined at the processor pins, unless noted otherwise. See [Signal Description](#) on page 80 for the processor pin listings and signal definitions.

- The DC specifications for the DDR3L signals are listed in the *Voltage and Current Specifications* section.
- The *Voltage and Current Specifications* section lists the DC specifications for the processor and are valid only while meeting specifications for junction temperature, clock frequency, and input voltages. Read all notes associated with each parameter.
- AC tolerances for all DC rails include dynamic load currents at switching frequencies up to 1 MHz.

7.8 Voltage and Current Specifications

Table 44. Processor Core (V_{CC}) Active and Idle Mode DC Voltage and Current Specifications

Symbol	Parameter	Segment	Min	Typ	Max	Units	Notes
Operating VID	VID Range for Processor Operating Mode	47 W	1.65	1.8	1.86	V	1, 2, 7
Idle VID	VID Range for Processor Idle Mode (Package C6)	47 W	1.5	1.6	1.65	V	1, 2, 7
I _{CCMAX}	Maximum Processor Core I _{CC}	47 W	—	—	85	A	4, 7
TOL _{VCC}	Voltage Tolerance	PS0, PS1	—	—	± 20	mV	6, 8
		PS2, PS3	—	—	± 20		
Ripple	Ripple Tolerance	PS0	—	—	± 10	mV	6, 8
		PS1	—	—	± 15		
		PS2	—	—	+50/-15		
		PS3	—	—	+60/-15		
R_DC_LL	Loadline slope within the VR regulation loop capability	47 W	—	-1.5	—	mΩ	—
R_AC_LL	Loadline slope in response to dynamic load increase events	47 W	—	-2.4	—	mΩ	—
R_AC_LL_OS	Loadline slope in response to dynamic load release events	47 W	—	-3.0	—	mΩ	—
T_OVS_Max	Max Overshoot Time	47 W	—	—	500	μs	—
V_OVS	Max Overshoot	47 W	—	—	50	mV	9

**Table 45. Memory Controller (V_{DDQ}) Supply DC Voltage and Current Specifications**

Symbol	Parameter	Min	Typ	Max	Unit	Note
V _{DDQ} (DC+AC) DDR3L/DDR3L-RS	Processor I/O supply voltage for DDR3L/DDR3L-RS (DC + AC specification)	Typ-5%	1.35	Typ+5%	V	2, 3
I _{CCMAX_VDDQ} (DDR3L/DDR3L-RS)	Max Current for V _{DDQ} Rail	—	—	2.1	A	1
I _{CCAVG_VDDQ} (Standby)	Average Current for V _{DDQ} Rail during Standby	—	12	20	mA	4
Notes: 1. The current supplied to the SO-DIMM modules is not included in this specification. 2. Includes AC and DC error, where the AC noise is bandwidth limited to under 20 MHz. 3. No requirement on the breakdown of AC versus DC noise. 4. Measured at 50 °C						

Table 46. VCCIO_OUT, VCOMP_OUT, and VCCIO_TERM

Symbol	Parameter	Typ	Max	Units	Notes
VCCIO_OUT	Termination Voltage	1.0	—	V	
ICCIO_OUT	Maximum External Load	—	300	mA	
VCOMP_OUT	Termination Voltage	1.0	—	V	1
VCCIO_TERM	Termination Voltage	1.0	—	V	2
Notes: 1. VCOMP_OUT may only be used to connect to PEG_RCOMP and eDP_RCOMP. 2. Internal processor power for signal termination.					

Table 47. DDR3L / DDR3L-RS Signal Group DC Specifications

<p>Notes: 1. Unless otherwise noted, all specifications in this table apply to all processor frequencies.</p> <p>2. V_{IL} is defined as the maximum voltage level at a receiving agent that will be interpreted as a logical low value.</p> <p>3. V_{IH} is defined as the minimum voltage level at a receiving agent that will be interpreted as a logical high value.</p> <p>4. V_{IH} and V_{OH} may experience excursions above V_{DDQ}. However, input signal drivers must comply with the signal quality specifications.</p> <p>5. This is the pull up/down driver resistance.</p> <p>6. R_{TERM} is the termination on the DIMM and is not controlled by the processor.</p> <p>7. The minimum and maximum values for these signals are programmable by BIOS to one of the two sets.</p> <p>8. SM_RCOMPx resistance must be provided on the system board with 1% resistors. SM_RCOMPx resistors are to V_{SS}.</p> <p>9. SM_DRAMPWROK rise and fall time must be < 50 ns measured between $V_{DDQ} * 0.15$ and $V_{DDQ} * 0.47$.</p> <p>10. SM_VREF is defined as $V_{DDQ}/2$.</p> <p>11. Maximum-minimum range is correct; however, center point is subject to change during MRC boot training.</p> <p>12. Processor may be damaged if V_{IH} exceeds the maximum voltage for extended periods.</p> <p>13. The MRC during boot training might optimize R_{ON} outside the range specified.</p>						

Table 48. Digital Display Interface Group DC Specifications

Symbol	Parameter	Min	Typ	Max	Units
V_{IL}	HPD Input Low Voltage	—	—	0.8	V
V_{IH}	HPD Input High Voltage	2.25	—	3.6	V
$V_{aux}(Tx)$	Aux peak-to-peak voltage at transmitting device	0.39	—	1.38	V
$V_{aux}(Rx)$	Aux peak-to-peak voltage at receiving device	0.32	—	1.36	V

Table 49. embedded DisplayPort* (eDP*) Group DC Specifications

Symbol	Parameter	Min	Typ	Max	Units
V_{IL}	HPD Input Low Voltage	0.02	—	0.21	V
V_{IH}	HPD Input High Voltage	0.84	—	1.05	V
V_{OL}	eDP_DISP_UTIL Output Low Voltage	$0.1 * V_{CC}$	—	—	V
V_{OH}	eDP_DISP_UTIL Output High Voltage	$0.9 * V_{CC}$	—	—	V
R_{UP}	eDP_DISP_UTIL Internal pull-up	100	—	—	Ω
R_{DOWN}	eDP_DISP_UTIL Internal pull-down	100	—	—	Ω
$V_{aux}(Tx)$	Aux peak-to-peak voltage at transmitting device	0.39	—	1.38	V
$V_{aux}(Rx)$	Aux peak-to-peak voltage at receiving device	0.32	—	1.36	V
eDP_RCOMP	COMP Resistance	24.75	25	25.25	Ω
Note: 1. COMP resistance is to VCOMP_OUT.					

Table 50. CMOS Signal Group DC Specifications

Symbol	Parameter	Min	Max	Units	Notes ¹
V _{IL}	Input Low Voltage	—	V _{CCIO_OUT} * 0.3	V	2
V _{IH}	Input High Voltage	V _{CCIO_OUT} * 0.7	—	V	2, 4
V _{OL}	Output Low Voltage	—	V _{CCIO_OUT} * 0.1	V	2
V _{OH}	Output High Voltage	V _{CCIO_OUT} * 0.9	—	V	2, 4
R _{ON}	Buffer on Resistance	23	73	Ω	—
I _{LI}	Input Leakage Current	—	±150	μA	3

Notes: 1. Unless otherwise noted, all specifications in this table apply to all processor frequencies.
2. The V_{CCIO_OUT} referred to in these specifications refers to instantaneous V_{CCIO_OUT}.
3. For VIN between "0" V and V_{CCIO_OUT}. Measured when the driver is tri-stated.
4. V_{IH} and V_{OH} may experience excursions above V_{CCIO_OUT}. However, input signal drivers must comply with the signal quality specifications.

Table 51. GTL Signal Group and Open Drain Signal Group DC Specifications

Symbol	Parameter	Min	Max	Units	Notes ¹
V _{IL}	Input Low Voltage (TAP, except TCK)	—	V _{CCIO_TERM} * 0.6	V	2
V _{IH}	Input High Voltage (TAP, except TCK)	V _{CCIO_TERM} * 0.72	—	V	2, 4
V _{IL}	Input Low Voltage (TCK)	—	V _{CCIO_TERM} * 0.4	V	2
V _{IH}	Input High Voltage (TCK)	V _{CCIO_TERM} * 0.8	—	V	2, 4
V _{HYSTERESIS}	Hysteresis Voltage	V _{CCIO_TERM} * 0.2	—	V	—
R _{ON}	Buffer on Resistance (TDO)	12	28	Ω	—
V _{IL}	Input Low Voltage (other GTL)	—	V _{CCIO_TERM} * 0.6	V	2
V _{IH}	Input High Voltage (other GTL)	V _{CCIO_TERM} * 0.72	—	V	2, 4
R _{ON}	Buffer on Resistance (CFG/BPM)	16	24	Ω	—
R _{ON}	Buffer on Resistance (other GTL)	12	28	Ω	—
I _{LI}	Input Leakage Current	—	±150	μA	3

Notes: 1. Unless otherwise noted, all specifications in this table apply to all processor frequencies.
2. The V_{CCIO_OUT} referred to in these specifications refers to instantaneous V_{CCIO_OUT}.
3. For VIN between 0 V and V_{CCIO_TERM}. Measured when the driver is tri-stated.
4. V_{IH} and V_{OH} may experience excursions above V_{CCIO_TERM}. However, input signal drivers must comply with the signal quality specifications.

Table 52. PCI Express* DC Specifications

Symbol	Parameter	Min	Typ	Max	Units	Notes ¹
Z _{TX-DIFF-DC}	DC Differential Tx Impedance (Gen 1 Only)	80	—	120	Ω	1, 6
Z _{TX-DIFF-DC}	DC Differential Tx Impedance (Gen 2 and Gen 3)	—	—	120	Ω	1, 6
Z _{RX-DC}	DC Common Mode Rx Impedance	40	—	60	Ω	1, 4, 5

continued...

Symbol	Parameter	Min	Typ	Max	Units	Notes ¹
$Z_{RX-DIFF-DC}$	DC Differential Rx Impedance (Gen1 Only)	80	—	120	Ω	1
PEG_RCOMP	Comp Resistance	24.75	25	25.25	Ω	2, 3
Notes: 1. See the <i>PCI Express Base Specification</i> for more details. 2. PEG_RCOMP should be connected to V_{COMP_OUT} through a $25\ \Omega \pm 1\%$ resistor. 3. Intel allows using $24.9\ \Omega \pm 1\%$ resistors. 4. DC impedance limits are needed to ensure Receiver detect. 5. The Rx DC Common Mode Impedance must be present when the Receiver terminations are first enabled to ensure that the Receiver Detect occurs properly. Compensation of this impedance can start immediately and the 15 Rx Common Mode Impedance (constrained by RLRX-CM to $50\ \Omega \pm 20\%$) must be within the specified range by the time Detect is entered. 6. Low impedance defined during signaling. Parameter is captured for 5.0 GHz by RLTX-DIFF.						

8.0 Package Specifications

8.1 Package Mechanical Specifications

The processor is a Flip Chip technology package available in Ball Grid Array (BGA). The following table provides an overview of the mechanical attributes of the package.

Table 53. Package Mechanical Attributes

Type	Parameter	H-Processor Line
Package Technology	Package Type	Flip Chip Ball Grid Array
	Interconnect	Ball Grid Array (BGA)
	Lead Free	Yes
	Halogenated Flame Retardant Free	Yes
Package Configuration	Solder Ball Composition	SAC405
	Ball/Pin Count	1364
	Grid Array Pattern	Balls Anywhere
	Land Side Capacitors	Yes
	Die Side Capacitors	Yes
	Die Configuration	Multi-chip/2 dies
Package Dimensions	Nominal Package Size	37.5 x 32.0 mm
	Min Ball/Pin pitch	0.7 mm

8.2 Package Loading Specifications

Table 54. Package Loading Specifications

Maximum Static Normal Load	Limit	Notes
BGA1364	111 N (25 lbf)	1, 2, 3, 4, 5
	67 N (15 lbf)	1, 2, 3, 4
Notes: 1. The thermal solution attach mechanism must not induce continuous stress to the package. It may only apply a uniform load to the die to maintain a thermal interface. 2. This specification applies to the uniform compressive load in the direction perpendicular to the die top surface. It is the nominal + tolerance maximum load. 3. This specification is based on limited testing for design characterization. 4. Assumes a motherboard thickness of 1.0 mm or greater. 5. Assumes the use of a backing plate.		

8.3 Package Storage Specifications

Table 55. BGA Package Storage Conditions

Parameter	Description	Min	Max	Notes
T _{ABSOLUTE STORAGE}	The non-operating device storage temperature. Damage (latent or otherwise) may occur when subjected to for any length of time.	-25 °C	125 °C	1, 2, 3
T _{SUSTAINED STORAGE}	The ambient storage temperature limit (in shipping media) for a sustained period of time.	-5 °C	40 °C	4, 5
RH _{SUSTAINED STORAGE}	The maximum device storage relative humidity for a sustained period of time.	60% @ 24 °C		5, 6
TIME _{SUSTAINED STORAGE}	A prolonged or extended period of time; typically associated with customer shelf life.	0 months	6 months	6
Notes: 1. Refers to a component device that is not assembled in a board or socket that is not to be electrically connected to a voltage reference or I/O signals. 2. Specified temperatures are based on data collected. Exceptions for surface mount reflow are specified in by applicable JEDEC standard . Non-adherence may affect processor reliability. 3. T _{ABSOLUTE STORAGE} applies to the unassembled component only and does not apply to the shipping media, moisture barrier bags or desiccant. 4. Intel-branded board products are certified to meet the following temperature and humidity limits that are given as an example only (Non-Operating Temperature Limit: -40 °C to 70 °C, Humidity: 50% to 90%, non-condensing with a maximum wet bulb of 28°C). Post board attach storage temperature limits are not specified for non-Intel branded boards. 5. The JEDEC, J-JSTD-020 moisture level rating and associated handling practices apply to all moisture sensitive devices removed from the moisture barrier bag. 6. Nominal temperature and humidity conditions and durations are given and tested within the constraints imposed by T _{SUSTAINED STORAGE} and customer shelf life in applicable Intel box and bags.				

9.0 Processor Pin and Signal Information

This chapter provides the processor pin information. The following table provides the BGA1364 processor ball list by signal name.

Table 56. BGA1364 Processor Ball List by Signal Name

**Стандарт
Электрон
Связь**

Мы молодая и активно развивающаяся компания в области поставок электронных компонентов. Мы поставляем электронные компоненты отечественного и импортного производства напрямую от производителей и с крупнейших складов мира.

Благодаря сотрудничеству с мировыми поставщиками мы осуществляем комплексные и плановые поставки широчайшего спектра электронных компонентов.

Собственная эффективная логистика и склад в обеспечивает надежную поставку продукции в точно указанные сроки по всей России.

Мы осуществляем техническую поддержку нашим клиентам и предпродажную проверку качества продукции. На все поставляемые продукты мы предоставляем гарантию .

Осуществляем поставки продукции под контролем ВП МО РФ на предприятия военно-промышленного комплекса России , а также работаем в рамках 275 ФЗ с открытием отдельных счетов в уполномоченном банке. Система менеджмента качества компании соответствует требованиям ГОСТ ISO 9001.

Минимальные сроки поставки, гибкие цены, неограниченный ассортимент и индивидуальный подход к клиентам являются основой для выстраивания долгосрочного и эффективного сотрудничества с предприятиями радиоэлектронной промышленности, предприятиями ВПК и научно-исследовательскими институтами России.

С нами вы становитесь еще успешнее!
