**PART NOMENCLATURE**

**SYMBOLS & DEFINITIONS**

Symbol	Definition
$h_{FE}$	Common-emitter static forward current transfer ratio: The ratio of the dc output current to the dc input current with the output voltage held constant.
$I_B$	Base current: The value of the dc current into the base terminal.
$I_C$	Collector current: The value of the dc current into the collector terminal.
$I_{CBO}$	Collector cutoff current, emitter open: The current into the collector terminal when it is biased in the reverse direction with respect to the base terminal and the emitter terminal is open-circuited.
$I_{CEX}$	Collector cutoff current, circuit between base and emitter: The current into the collector terminal when it is biased in the reverse direction with respect to the emitter terminal, and the base terminal is returned to the emitter terminal through a specified circuit. The collector terminal is considered to be biased in the reverse direction when it is made positive for npn transistors, or negative for pnp transistors, with respect to the emitter terminal.
$I_{EBO}$	Emitter cutoff current, collector open: The current into the emitter terminal when it is biased in the reverse direction with respect to the base terminal and the collector terminal is open-circuited.
$V_{(BR)CEO}$	Collector-emitter breakdown voltage, base open. The breakdown voltage between the collector and emitter terminals when the collector terminal is biased in the reverse direction with respect to the emitter terminal, and the base terminal is open circuited. The collector terminal is considered to be biased in the reverse direction when it is made positive for npn transistors, or negative for pnp transistors, with respect to the emitter terminal.
$V_{BE(sat)}$	Base-emitter saturation voltage: The voltage between the base and emitter terminals for specified base current and collector current conditions that are intended to ensure that the collector junction is forward biased.
$V_{CB}$	Collector-base voltage: The dc voltage between the collector and the base.
$V_{CBO}$	Collector-base voltage, emitter open: The voltage between the collector and base terminals when the emitter terminal is open-circuited.
$V_{CE}$	Collector-emitter voltage: The dc voltage between the collector and the emitter.
$V_{CE(sat)}$	Collector-emitter saturation voltage: The voltage between the collector and emitter terminals under conditions of base current or base-emitter voltage beyond which the collector current remains essentially constant as the base current or voltage is increased.
$V_{CEO}$	Collector-emitter voltage, base open: The voltage between the collector and the emitter terminals when the base terminal is open-circuited.
$V_{EB}$	Emitter-base voltage: The dc voltage between the emitter and the base
$V_{EBO}$	Emitter-base voltage, collector open: The voltage between the emitter and base terminals with the collector terminal open-circuited.
