1 TMS320DM6433 Digital Media Processor

1.1 Features

- High-Performance Digital Media Processor (DM6433)
  - 2.5-, 2-, 1.67-, 1.51-, 1.43-ns ns Instruction Cycle Time
  - 400-, 500, -600-, 660-, 700-MHz C64x+™ Clock Rate
  - Eight 32-Bit C64x+ Instructions/Cycle
  - 3200, 4000, 4800, 5280, 5600 MIPS
  - Fully Software-Compatible With C64x
  - Commercial and Automotive (Q or S suffix) Grades
  - Low-Power Device (L suffix)
- VelociTI.2™ Extensions to VelociTI™ Advanced Very-Long-Instruction-Word (VLIW) TMS320C64x+™ DSP Core
  - Eight Highly Independent Functional Units With VelociTI.2 Extensions:
    - Six ALUs (32-/40-Bit), Each Supports Single 32-Bit, Dual 16-Bit, or Quad 8-Bit Arithmetic per Clock Cycle
    - Two Multipliers Support Four 16 x 16-Bit Multiplies (32-Bit Results) per Clock Cycle or Eight 8 x 8-Bit Multiplies (16-Bit Results) per Clock Cycle
  - Load-Store Architecture With Non-Aligned Support
  - 64 32-Bit General-Purpose Registers
  - Instruction Packing Reduces Code Size
  - All Instructions Conditional
  - Additional C64x+™ Enhancements
    - Protected Mode Operation
    - Exceptions Support for Error Detection and Program Redirection
    - Hardware Support for Modulo Loop Auto-Focus Module Operation
- C64x+ Instruction Set Features
  - Byte-Addressable (8-/16-/32-/64-Bit Data)
  - 8-Bit Overflow Protection
  - Bit-Field Extract, Set, Clear
  - Normalization, Saturation, Bit-Counting
  - VelociTI.2 Increased Orthogonality
  - C64x+ Extensions
    - Compact 16-bit Instructions
    - Additional Instructions to Support Complex Multiplies
- C64x+ L1/L2 Memory Architecture
  - 256K-Bit (32K-Byte) L1P Program RAM/Cache [Flexible Allocation]
  - 640K-Bit (80K-Byte) L1D Data RAM/Cache [Flexible Allocation]
  - 1M-Bit (128K-Byte) L2 Unified Mapped RAM/Cache [Flexible Allocation]
- Supports Little Endian Mode Only
- Video Processing Subsystem (VPSS)
  - Front End Provides (Resizer Only):
    - Resize Images From 1/4x to 4x
    - Separate Horizontal and Vertical Control
  - Back End Provides:
    - Hardware On-Screen Display (OSD)
    - Four 54-MHz DACs for a Combination of
      - Composite NTSC/PAL Video
      - Luma/Chroma Separate Video (S-video)
      - Component (YPbPr or RGB) Video (Progressive)
    - Digital Output
      - 8-/16-bit YUV or up to 24-Bit RGB
      - HD Resolution
      - Up to 2 Video Windows
- External Memory Interfaces (EMIFs)
  - 32-Bit DDR2 SDRAM Memory Controller With 256M-Byte Address Space (1.8-V I/O)
    - Supports up to 333-MHz (data rate) bus and interfaces to DDR2-400 SDRAM
  - Asynchronous 8-Bit Wide EMIF (EMIFA) With up to 64M-Byte Address Reach
    - Flash Memory Interfaces
      - NOR (8-Bit-Wide Data)
      - NAND (8-Bit-Wide Data)
- Enhanced Direct-Memory-Access (EDMA) Controller (64 Independent Channels)
- Two 64-Bit General-Purpose Timers (Each Configurable as Two 32-Bit Timers)
- One 64-Bit Watch Dog Timer
- One UART With RTS and CTS Flow Control
- Master/Slave Inter-Integrated Circuit (I^2C Bus™)
- One Multichannel Buffered Serial Port (McBSP0)
  - I2S and TDM
  - AC97 Audio Codec Interface

- **Packages:**
  - **361-Pin Pb-Free PBGA Package (ZWT Suffix), 0.8-mm Ball Pitch**
  - **376-Pin Plastic BGA Package (ZDU Suffix), 1.0-mm Ball Pitch**
- **0.09-μm/6-Level Cu Metal Process (CMOS)**
- **3.3-V and 1.8-V I/O, 1.2-V Internal (-7/-6/-5/-4/-L/-Q6/-Q5/-Q4)**
- **3.3-V and 1.8-V I/O, 1.05-V Internal (-7/-6/-5/-4/-L/-Q5)**
- **Applications:**
  - **Digital Media**
  - **Networked Media Decode**

1.2 Description

The TMS320C64x+™ DSPs (including the TMS320DM6433 device) are the highest-performance fixed-point DSP generation in the TMS320C6000™ DSP platform. The DM6433 device is based on the third-generation high-performance, advanced VelociTI™ very-long-instruction-word (VLIW) architecture developed by Texas Instruments (TI), making these DSPs an excellent choice for digital media applications. The C64x+™ devices are upward code-compatible from previous devices that are part of the C6000™ DSP platform. The C64x™ DSPs support added functionality and have an expanded instruction set from previous devices.

Any reference to the C64x DSP or C64x CPU also applies, unless otherwise noted, to the C64x+ DSP and C64x+ CPU, respectively.

With performance of up to 5600 million instructions per second (MIPS) at a clock rate of 700 MHz, the C64x+ core offers solutions to high-performance DSP programming challenges. The DSP core possesses the operational flexibility of high-speed controllers and the numerical capability of array processors. The C64x+ DSP core processor has 64 general-purpose registers of 32-bit word length and eight highly independent functional units—two multipliers for a 32-bit result and six arithmetic logic units (ALUs). The eight functional units include instructions to accelerate the performance in video and imaging applications. The DSP core can produce four 16-bit multiply-accumulates (MACs) per cycle for a total of 2800 million MACs per second (MMACS), or eight 8-bit MACs per cycle for a total of 5600 MMACS. For more details on the C64x+ DSP, see the *TMS320C64x/C64x+ DSP CPU and Instruction Set Reference Guide* (literature number SPRU732).

The DM6433 also has application-specific hardware logic, on-chip memory, and additional on-chip peripherals similar to the other C6000 DSP platform devices. The DM6433 core uses a two-level cache-based architecture. The Level 1 program memory/cache (L1P) consists of a 256K-bit memory space that can be configured as mapped memory or direct mapped cache, and the Level 1 data (L1D) consists of a 640K-bit memory space —384K-bit of which is mapped memory and 256K-bit of which can be configured as mapped memory or 2-way set-associative cache. The Level 2 memory/cache (L2) consists of a 1M-bit memory space that is shared between program and data space. L2 memory can be configured as mapped memory, cache, or combinations of the two.

The peripheral set includes: 1 configurable video port; a 10/100 Mb/s Ethernet MAC (EMAC) with a management data input/output (MDIO) module; a 4-bit transmit, 4-bit receive VLYNQ interface; an inter-integrated circuit (I2C) Bus interface; a multichannel buffered serial port (McBSP0); a multichannel audio serial port (McASP0) with 4 serializers; 2 64-bit general-purpose timers each configurable as 2 independent 32-bit timers; 1 64-bit watchdog timer; a user-configurable 16-bit host-port interface (HPI); up to 111-pins of general-purpose input/output (GPIO) with programmable interrupt/event generation modes, multiplexed with other peripherals; a UART with hardware handshaking support; 3 pulse width modulator (PWM) peripherals; 1 peripheral component interconnect (PCI) [33 MHz]; and 2 glueless external memory interfaces: an asynchronous external memory interface (EMIFA) for slower memories/peripherals, and a higher speed synchronous memory interface for DDR2.

The DM6433 device includes a Video Processing Subsystem (VPSS) with a Video Processing Back-End (VPBE) output.

The Video Processing Back-End (VPBE) is comprised of an On-Screen Display Engine (OSD) and a Video Encoder (VENC). The OSD engine is capable of handling 2 separate video windows and 2 separate OSD windows. Other configurations include 2 video windows, 1 OSD window, and 1 attribute window allowing up to 8 levels of alpha blending. The VENC provides four analog DACs that run at 54 MHz, providing a means for composite NTSC/PAL video, S-Video, and/or Component video output. The VENC also provides up to 24 bits of digital output to interface to RGB888 devices. The digital output is capable of 8/16-bit BT.656 output and/or CCIR.601 with separate horizontal and vertical syncs.

The Resizer accepts image data for separate horizontal and vertical resizing from 1/4x to 4x in increments of 256/N, where N is between 64 and 1024.

The Ethernet Media Access Controller (EMAC) provides an efficient interface between the DM6433 and the network. The DM6433 EMAC support both 10Base-T and 100Base-TX, or 10 Mbits/second (Mbps) and 100 Mbps in either half- or full-duplex mode, with hardware flow control and quality of service (QOS) support.

The Management Data Input/Output (MDIO) module continuously polls all 32 MDIO addresses in order to enumerate all PHY devices in the system.

The I2C and VLYNQ ports allow DM6433 to easily control peripheral devices and/or communicate with host processors.

The rich peripheral set provides the ability to control external peripheral devices and communicate with external processors. For details on each of the peripherals, see the related sections later in this document and the associated peripheral reference guides.

The DM6433 has a complete set of development tools. These include C compilers, a DSP assembly optimizer to simplify programming and scheduling, and a Windows™ debugger interface for visibility into source code execution.

Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

This data manual revision history highlights the technical changes made to the SPRS343B device-specific data manual to make it an SPRS343C revision.

Scope: Applicable updates to the TMS320DM643x DMP, specifically relating to the TMS320DM6433 device, have been incorporated.

- Added 660- and 700-MHz C64x+™ device speeds.
- Added designators for low-power (-L) devices.

SEE	ADDITIONS/MODIFICATIONS/DELETIONS
Section 1.1	Added "5280, 5600 MIPS" ***to*** "High-Performance Digital Signal Processor (DM6437)" bullet
Section 1.2	• In first paragraph, updated/changed the following: – First sentence ***from*** "With performance up to 4800 million instructions per second (MIPS) at a clock rate of 600 MHz..." ***to*** "With performance up to 5600 million instructions per second (MIPS) with a clock rate of 700 MHz..." – Fifth sentence ***from*** "The DSP core can produce...for a total of 2400 million MACs per second...or a total of 4800 MMACS."***to*** "The DSP core can produce...for a total of 2800 million MACs per second...or a total of 5600 MMACS."
Section 2.6	Table 2-23, *Multichannel Audio Serial Port (McASP0) Terminal Functions*: • Updated/Changed AFSR0/DR0/GP[100] pin description ***from*** "... frame synchronization AFSX0..." ***to*** "...frame synchronization AFSR0..." • Updated/Changed AFSX0/DX1/GP[107] pin description from "...frame synchronization AFSR0..." ***to*** "...frame synchronization AFSX0..." HARDWARE FEATURES		DM6433
Product Status(3)	Product Preview (PP), Advance Information (AI), or Production Data (PD)	PD

(3) PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

2.2 CPU (DSP Core) Description

The C64x+ Central Processing Unit (CPU) consists of eight functional units, two register files, and two data paths as shown in Figure 2-1. The two general-purpose register files (A and B) each contain 32 32-bit registers for a total of 64 registers. The general-purpose registers can be used for data or can be data address pointers. The data types supported include packed 8-bit data, packed 16-bit data, 32-bit data, 40-bit data, and 64-bit data. Values larger than 32 bits, such as 40-bit-long or 64-bit-long values are stored in register pairs, with the 32 LSBs of data placed in an even register and the remaining 8 or 32 MSBs in the next upper register (which is always an odd-numbered register).

The eight functional units (.M1, .L1, .D1, .S1, .M2, .L2, .D2, and .S2) are each capable of executing one instruction every clock cycle. The .M functional units perform all multiply operations. The .S and .L units perform a general set of arithmetic, logical, and branch functions. The .D units primarily load data from memory to the register file and store results from the register file into memory.

The C64x+ CPU extends the performance of the C64x core through enhancements and new features.

Each C64x+ .M unit can perform one of the following each clock cycle: one 32 x 32 bit multiply, one 16 x 32 bit multiply, two 16 x 16 bit multiplies, two 16 x 32 bit multiplies, two 16 x 16 bit multiplies with add/subtract capabilities, four 8 x 8 bit multiplies, four 8 x 8 bit multiplies with add operations, and four 16 x 16 multiplies with add/subtract capabilities (including a complex multiply). There is also support for Galois field multiplication for 8-bit and 32-bit data. Many communications algorithms such as FFTs and modems require complex multiplication. The complex multiply (CMPY) instruction takes for 16-bit inputs and produces a 32-bit real and a 32-bit imaginary output. There are also complex multiplies with rounding capability that produces one 32-bit packed output that contain 16-bit real and 16-bit imaginary values. The 32 x 32 bit multiply instructions provide the extended precision necessary for audio and other high-precision algorithms on a variety of signed and unsigned 32-bit data types.

The .L or (Arithmetic Logic Unit) now incorporates the ability to do parallel add/subtract operations on a pair of common inputs. Versions of this instruction exist to work on 32-bit data or on pairs of 16-bit data performing dual 16-bit add and subtracts in parallel. There are also saturated forms of these instructions.

The C64x+ core enhances the .S unit in several ways. In the C64x core, dual 16-bit MIN2 and MAX2 comparisons were only available on the .L units. On the C64x+ core they are also available on the .S unit which increases the performance of algorithms that do searching and sorting. Finally, to increase data packing and unpacking throughput, the .S unit allows sustained high performance for the quad 8-bit/16-bit and dual 16-bit instructions. Unpack instructions prepare 8-bit data for parallel 16-bit operations. Pack instructions return parallel results to output precision including saturation support.

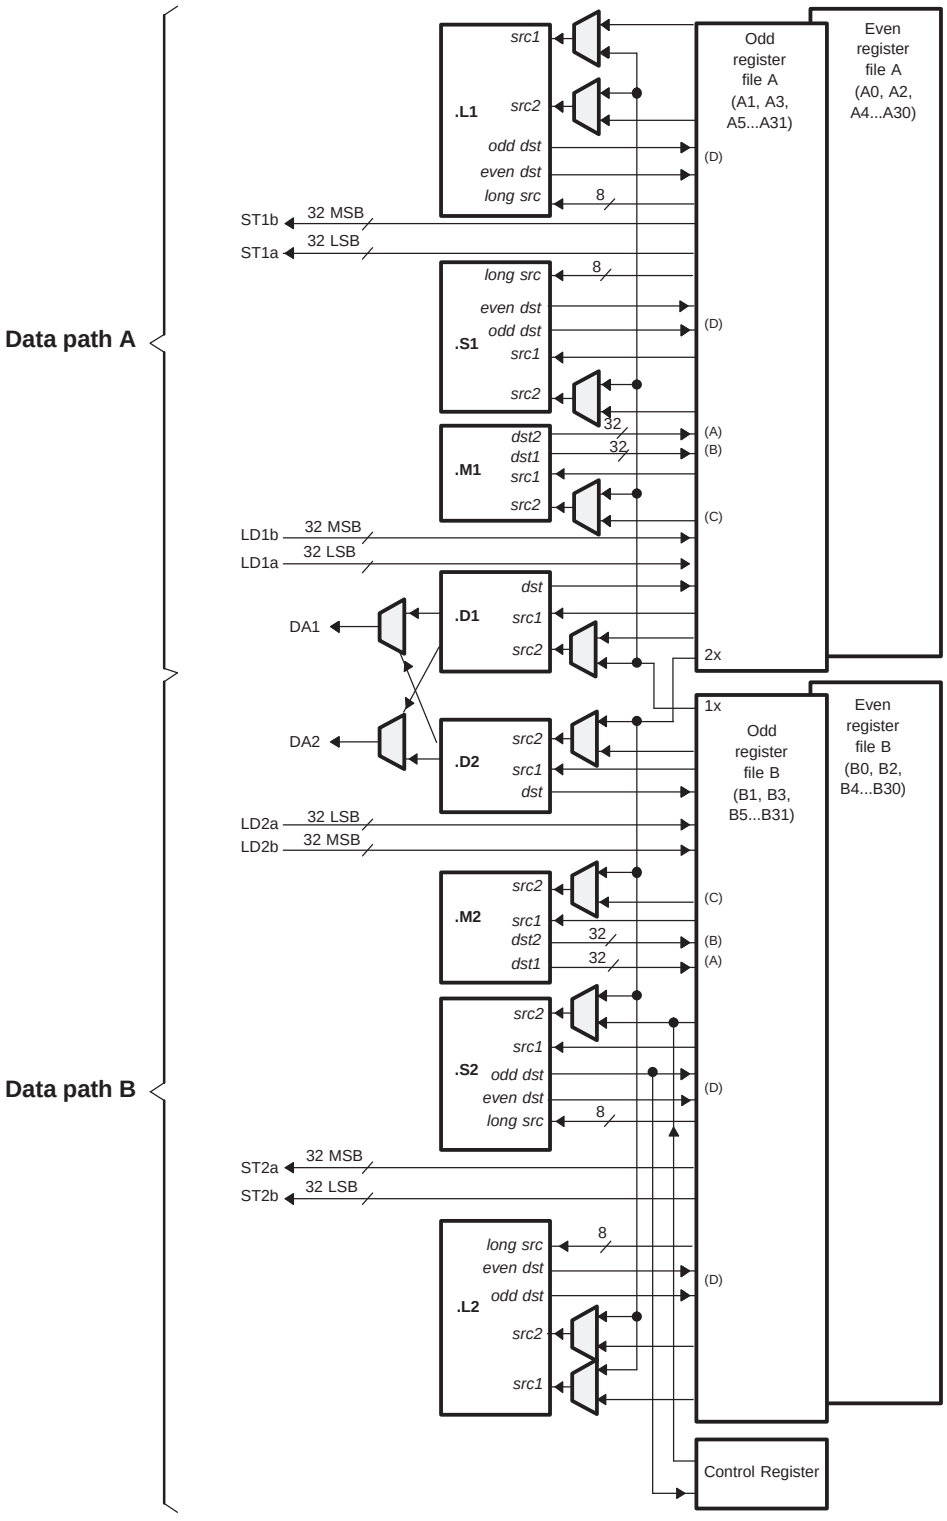
Other new features include:

- **SPLOOP** - A small instruction buffer in the CPU that aids in creation of software pipelining loops where multiple iterations of a loop are executed in parallel. The SPLOOP buffer reduces the code size associated with software pipelining. Furthermore, loops in the SPLOOP buffer are fully interruptible.
- **Compact Instructions** - The native instruction size for the C6000 devices is 32 bits. Many common instructions such as MPY, AND, OR, ADD, and SUB can be expressed as 16 bits if the C64x+ compiler can restrict the code to use certain registers in the register file. This compression is performed by the code generation tools.
- **Instruction Set Enhancement** - As noted above, there are new instructions such as 32-bit multiplications, complex multiplications, packing, sorting, bit manipulation, and 32-bit Galois field multiplication.

- **Exceptions Handling** - Intended to aid the programmer in isolating bugs. The C64x+ CPU is able to detect and respond to exceptions, both from internally detected sources (such as illegal op-codes) and from system events (such as a watchdog time expiration).
- **Privilege** - Defines user and supervisor modes of operation, allowing the operating system to give a basic level of protection to sensitive resources. Local memory is divided into multiple pages, each with read, write, and execute permissions.
- **Time-Stamp Counter** - Primarily targeted for Real-Time Operating System (RTOS) robustness, a free-running time-stamp counter is implemented in the CPU which is ***not*** sensitive to system stalls.

For more details on the C64x+ CPU and its enhancements over the C64x architecture, see the following documents:

- *TMS320C64x/C64x+ DSP CPU and Instruction Set Reference Guide* (literature number SPRU732)
- *TMS320C64x+ DSP Megamodule Reference Guide* (literature number SPRU871)
- *TMS320C64x to TMS320C64x+ CPU Migration Guide* Application Report (literature number SPRAA84)
- *TMS320C64x+ DSP Cache* User's Guide (literature number SPRU862)



A. On .M unit, *dst2* is 32 MSB.
B. On .M unit, *dst1* is 32 LSB.
C. On C64x CPU .M unit, *src2* is 32 bits; on C64x+ CPU .M unit, *src2* is 64 bits.
D. On .L and .S units, *odd dst* connects to odd register files and *even dst* connects to even register files.

Figure 2-1. TMS320C64x+™ CPU (DSP Core) Data Paths

2.3 C64x+ CPU

The C64x+ core uses a two-level cache-based architecture. The Level 1 Program memory/cache (L1P) consists of 32 KB memory space that can be configured as mapped memory or direct mapped cache. The Level 1 Data memory/cache (L1D) consists of 80 KB—48 KB of which is mapped memory and 32 KB of which can be configured as mapped memory or 2-way set associated cache. The Level 2 memory/cache (L2) consists of a 128 KB memory space that is shared between program and data space. L2 memory can be configured as mapped memory, cache, or a combination of both.

Table 2-2 shows a memory map of the C64x+ CPU cache registers for the device.

Table 2-2. C64x+ Cache Registers

HEX ADDRESS RANGE	REGISTER ACRONYM	DESCRIPTION
0x0184 0000	L2CFG	L2 Cache configuration register
0x0184 0020	L1PCFG	L1P Size Cache configuration register

2.4 Memory Map Summary

Table 2-3 shows the memory map address ranges of the device. Table 2-4 depicts the expanded map of the Configuration Space (0x0180 0000 through 0x0FFF FFFF). The device has multiple on-chip memories associated with its two processors and various subsystems. To help simplify software development a unified memory map is used where possible to maintain a consistent view of device resources across all bus masters.

Table 2-3. Memory Map Summary

START ADDRESS	END ADDRESS	SIZE (Bytes)	C64x+ MEMORY MAP	EDMA PERIPHERAL MEMORY MAP	VPSS MEMORY MAP	PCI MEMORY MAP

(1) For all bootmodes that default to DSPBOOTADDR = 0x0010 0000 (i.e., all boot modes except the EMIFA ROM Direct Boot, BOOTMODE[3:0] = 0100, FASTBOOT = 0), the bootloader code disables all C64x+ cache (L2, L1P, and L1D) so that upon exit from the bootloader code, all C64x+ memories are configured as all RAM (L2CFG.L2MODE = 0h, L1PCFG.L1PMODE = 0h, and L1DCFG.L1DMODE = 0h). If cache use is required, the application code must explicitly enable the cache. For more information on boot modes, see Section 3.4.1, *Boot Modes*. For more information on the bootloader, see the *Using the TMS320DM643x Bootloader* Application Report (literature number SPRAAG0). For the EMIFA ROM Direct Boot (BOOTMODE[3:0] = 0100, FASTBOOT = 0), the bootloader is not executed—that is, L2 RAM/Cache defaults to all RAM (L2CFG.L2MODE = 0h); L1P RAM/Cache defaults to all cache (L1PCFG.L1PMODE = 7h); and L1D RAM/Cache defaults to all cache (L1DCFG.L1DMODE = 7h).

(2) The EMIFA $\overline{CS0}$ and $\overline{CS1}$ are ***not*** functionally supported on the DM6433 device, and therefore, are ***not*** pinned out.

2.5 Pin Assignments

Extensive use of pin multiplexing is used to accommodate the largest number of peripheral functions in the smallest possible package. Pin multiplexing is controlled using a combination of hardware configuration at device reset and software programmable register settings. For more information on pin muxing, see TBD, *Multiplexed Pin Configurations* of this document.

2.5.1 Pin Map (Bottom View)

Figure 2-2 through Figure 2-5 show the bottom view of the **ZWT** package pin assignments in four quadrants (A, B, C, and D). Figure 2-6 through Figure 2-9 show the bottom view of the **ZDU** package pin assignments in four quadrants (A, B, C, and D).

2.6 Terminal Functions

The terminal functions tables (Table 2-5 through Table 2-31) identify the external signal names, the associated pin (ball) numbers along with the mechanical package designator, the pin type, whether the pin has any internal pullup or pulldown resistors, and a functional pin description. For more detailed information on device configuration, peripheral selection, multiplexed/shared pin, and debugging considerations, see the Device Configurations section of this data manual.

All device boot and configuration pins (except PCIEN) are multiplexed configuration pins— meaning they are multiplexed with functional pins. These pins function as device boot and configuration pins only during device reset. The input states of these pins are sampled and latched into the BOOTCFG register when device reset is deasserted (see **Note** below). After device reset is deasserted, the values on these multiplexed pins no longer have to hold the configuration.

The PCIEN pin is a standalone configuration pin. Its value is latched into the BOOTCFG register when device reset is deasserted (see **Note** below). Unlike the multiplexed device boot and configuration pins, the value on the PCIEN pin even after device reset is deasserted ***must*** hold the configuration.

For proper device operation, external pullup/pulldown resistors may be required on these device boot and configuration pins. Section 3.9.1, *Pullup/Pulldown Resistors* discusses situations where external pullup/pulldown resistors are required.

Note: Internal to the chip, the two device reset pins $\overline{\text{RESET}}$ and $\overline{\text{POR}}$ are logically AND'd together for the purpose of latching device boot and configuration pins. The values on all device boot and configuration pins are latched into the BOOTCFG register when the logical AND of $\overline{\text{RESET}}$ and $\overline{\text{POR}}$ transitions from low-to-high.

Table 2-5. BOOT Terminal Functions

SIGNAL			TYPE(1)	OTHER(2)(3)	DESCRIPTION
NAME	ZWT NO.	ZDU NO.			
BOOT					
YOUT3/GP[25]/ (BOOTMODE3) YOUT2/GP[24]/ (BOOTMODE2) YOUT1/GP[23]/ (BOOTMODE1) YOUT0/GP[22]/ (BOOTMODE0)	G16 G15 F15 F18	H21 L20 K20 J20	I/O/Z	IPD DV_{DD33}	Bootmode configuration bits. These bootmode functions along with the FASTBOOT function determine what device bootmode configuration is selected. The DM6433 device supports several types of bootmodes along with a FASTBOOT option; for more details on the types/options, see Section 3.4.1, *Boot Modes*.
YOUT4/GP26]/ (FASTBOOT)	G17	K19	I/O/Z	IPD DV_{DD33}	Fast Boot 0 = Not Fast Boot 1 = Fast Boot
R0/EM_A[4]/ GP[10]/(AEAW2/PLLMS2)	A17	B21	I/O/Z	IPD DV_{DD33}	EMIFA Address Bus Width (AEAW) and Fast Boot PLL Multiplier Select (PLLMS). These configuration pins serve two purposes which are based on AEM[2:0] settings. For AEM[2:0] = 001 [8-bit EMIFA (Async) Pinout Mode 1], the AEAW/PLLMS pins serve as the AEAW function to select EMIFA Address Bus Width. For all other AEM modes, the AEAW/PLLMS pins select the PLL multiplier for fast boot. For more details, see Section 3.5.1.2, *EMIFA Address Width Select (AEAW) and Fast Boot PLL Multipler Select (PLLMS)*.
G1/EM_A[1]/(ALE)/ GP[9]/ (AEAW1/PLLMS1)	A16	B20	I/O/Z	IPD DV_{DD33}

Table 2-6. Oscillator/PLL Terminal Functions

SIGNAL			TYPE[1]	OTHER[2]	DESCRIPTION
NAME	ZWT NO.	ZDU NO.			
OSCILLATOR, PLL					
MXI/ CLKIN	K19	N22	I	MXV_{DD}	Crystal input MXI for MX oscillator (system oscillator, typically 27 MHz). If the internal oscillator is bypassed, this is the external oscillator clock input.[3]
MXO	J19	M22	O	MXV_{DD}	Crystal output for MX oscillator
MXV_{DD}	L18	N21	S	(4)	1.8 V power supply for MX oscillator. On the board, this pin can be connected to the same 1.8 V power supply as DV_{DDR2}.
MXV_{SS}	K18	M21	GND	(4)	Ground for MX oscillator
PLL_{PWR18}	L16	N20	S	(4)	1.8 V power supply for PLLs

(1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal
(2) Specifies the operating I/O supply voltage for each signal
(3) For more information on external board connections, see Section 6.6, *External Clock Input From MXI/CLKIN Pin*.
(4) For more information, see the *Recommended Operating Conditions* table

Table 2-7. Clock Generator Terminal Functions

SIGNAL			TYPE[1]	OTHER[2][3]	DESCRIPTION
NAME	ZWT NO.	ZDU NO.			
CLOCK GENERATOR					
CLKOUT0/ PWM2/GP[84]	M1	R1	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between the System Clock generator (PLL1), PWM2, and GPIO. For the System Clock generator (PLL1), it is clock output CLKOUT0. This is configurable for 27 MHz or other 27 MHz-divided-down (/1 to /32) clock outputs.

(1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal
(2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see Section 3.9.1, *Pullup/Pulldown Resistors*.
(3) Specifies the operating I/O supply voltage for each signal

Table 2-8. RESET and JTAG Terminal Functions

SIGNAL			TYPE(1)	OTHER(2)(3)	DESCRIPTION
NAME	ZWT NO.	ZDU NO.			
RESET					
$\overline{\text{RESET}}$	M4	R3	I	IPU DV_{DD33}	Device reset
$\overline{\text{RESETOUT}}$	N3	T3	O/Z	– DV_{DD33}	Reset output status pin. The $\overline{\text{RESETOUT}}$ pin indicates when the device is in reset.
$\overline{\text{POR}}$	N4	R2	I	IPU DV_{DD33}	Power-on reset.
JTAG					
TMS	R3	V3	I	IPU DV_{DD33}	JTAG test-port mode select input. For proper device operation, ***do not*** oppose the IPU on this pin.
TDO	P3	U2	O/Z	– DV_{DD33}	JTAG test-port data output
TDI	P4	U3	I	IPU DV_{DD33}	JTAG test-port data input
TCK	N1	U1	I	IPU DV_{DD33}	JTAG test-port clock input
$\overline{\text{TRST}}$	R2	V2	I	IPD DV_{DD33}	JTAG test-port reset. For IEEE 1149.1 JTAG compatibility, see the IEEE 1149.1 JTAG compatibility statement portion of this data sheet
EMU1	N2	T2	I/O/Z	IPU DV_{DD33}	Emulation pin 1
EMU0	P2	T1	I/O/Z	IPU DV_{DD33}	Emulation pin 0

(1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal
(2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see Section 3.9.1, *Pullup/Pulldown Resistors*.
(3) Specifies the operating I/O supply voltage for each signal

Table 2-9. EMIFA Terminal Functions (Boot Configuration)

SIGNAL			TYPE(1)	OTHER(2)(3)	DESCRIPTION
NAME	ZWT NO.	ZDU NO.			
EMIFA: BOOT CONFIGURATION					
R0/EM_A[4]/ GP[10]/ (AEAW2/PLLMS2)	A17	B21	I/O/Z	IPD DV_{DD33}	These pins are multiplexed between the VPBE (VENC), EMIFA, and GPIO. When RESET or POR is asserted, these pins function as EMIFA configuration pins. At reset if AEM[2:0] = 001 (EMIFA in 8-bit Async mode), then the input states of AEAW[2:0] are sampled to set the EMIFA Address Bus Width. On DM6433, AEAW[2:0] ***must*** be set to 100b if AEM[2:0] = 001b. After reset, these pins function as VPBE (VENC), EMIFA, or GPIO pin functions based on pin mux selection. For more details on the AEAW/PLLMS functions, see Section 3.5.1.2, *EMIFA Address Bus Width (AEAW) and Fast Boot PLL Multiplier Select (PLLMS)*.
G1/EM_A[1]/ (ALE)/GP[9]/ (AEAW1/PLLMS1)	A16	B20	I/O/Z	IPD DV_{DD33}	
B1/EM_A[2]/ (CLE)/GP[8]/ (AEAW0/PLLMS0)	B16	A20	I/O/Z	DV_{DD33}	
B2/EM_BA[1]/ GP[5]/(AEM0)	C16	C20	I/O/Z	IPD DV_{DD33}	These pins are multiplexed between the VPBE (VENC), EMIFA, and GPIO. When RESET or POR is asserted, these pins function as EMIFA configuration pins. At reset, the input states of AEM[2:0] are sampled to set the EMIFA Pinout Mode. For more details, see Section 3.5.1, *Configurations at Reset*. After reset, these pins function as VPBE (VENC), EMIFA, or GPIO pin functions based on pin mux selection. For more details on the AEM functions, see Section 3.5.1.1, *EMIFA Pinout Mode (AEM[2:0])*.
R2/EM_BA[0]/ GP[6]/(AEM1)	C17	E20	I/O/Z	IPD DV_{DD33}	
R1/ EM_A[0]/ GP[7]/(AEM2)	B17	C21	I/O/Z	IPD DV_{DD33}	

(1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal
(2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see Section 3.9.1, *Pullup/Pulldown Resistors*.
(3) Specifies the operating I/O supply voltage for each signal

Table 2-10. EMIFA Terminal Functions (EMIFA Pinout Mode 1, AEM[2:0] = 001)

SIGNAL			TYPE(1)	OTHER(2)(3)	DESCRIPTION
NAME	ZWT NO.	ZDU NO.			
EMIFA FUNCTIONAL PINS: 8-Bit ASYNC/NOR (EMIFA Pinout Mode 1, AEM[2:0] = 001)					
Actual pin functions are determined by the PINMUX0 and PINMUX1 register bit settings (e.g., PCIEN, AEAW[2:0], AEM[2:0], etc.). For more details, see Section 3.7, *Multiplexed Pin Configurations*.					
G0/$\overline{\text{EM\_CS2}}$/ GP[12]	C19	C22	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between VPBE (VENC), EMIFA, and GPIO. For EMIFA, this pin is Chip Select 2 output $\overline{\text{EM\_CS2}}$ for use with asynchronous memories (i.e., NOR flash). This is the chip select for the default boot and ROM boot modes. ***Note:*** This pin features an internal pulldown (IPD). If this pin is connected and used as an EMIFA chip select signal, for proper device operation, an external pullup resistor ***must*** be used to ensure the $\overline{\text{EM\_CSx}}$ function defaults to an inactive (high) state.
LCD_OE/$\overline{\text{EM\_CS3}}$/ GP[13]	C18	D22	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between VPBE (VENC), EMIFA, and GPIO. For EMIFA, this pin is Chip Select 3 output $\overline{\text{EM\_CS3}}$ for use with asynchronous memories (i.e., NOR flash). ***Note:*** This pin features an internal pulldown (IPD). If this pin is connected and used as an EMIFA chip select signal, for proper device operation, an external pullup resistor ***must*** be used to ensure the $\overline{\text{EM\_CSx}}$ function defaults to an inactive (high) state.
VSYNC/$\overline{\text{EM\_CS4}}$/ GP[32]	E19	H22	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between VPBE (VENC), EMIFA, and GPIO. For EMIFA, it is Chip Select 4 output $\overline{\text{EM\_CS4}}$ for use with asynchronous memories (i.e., NOR flash). ***Note:*** This pin features an internal pulldown (IPD). If this pin is connected and used as an EMIFA chip select signal, for proper device operation, an external pullup resistor ***must*** be used to ensure the $\overline{\text{EM\_CSx}}$ function defaults to an inactive (high) state.
HSYNC/$\overline{\text{EM\_CS5}}$/ GP[33]	F19	J22	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between VPBE (VENC), EMIFA, and GPIO. For EMIFA, it is Chip Select 5 output $\overline{\text{EM\_CS5}}$ for use with asynchronous memories (i.e., NOR flash). ***Note:*** This pin features an internal pulldown (IPD). If this pin is connected and used as an EMIFA chip select signal, for proper device operation, an external pullup resistor ***must*** be used to ensure the $\overline{\text{EM\_CSx}}$ function defaults to an inactive (high) state.
EM_R/$\overline{\text{W}}$/ GP[35]	D13	C17	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between EMIFA and GPIO. For EMIFA, it is read/write output EM_R/$\overline{\text{W}}$.
EM_WAIT/ (RDY/BSY)	E15	D20	I/O/Z	IPU DV_{DD33}	For EMIFA (ASYNC/NOR), this pin is wait state extension input EM_WAIT.
$\overline{\text{EM\_OE}}$	D15	D19	I/O/Z	IPU DV_{DD33}	For EMIFA, it is output enable output $\overline{\text{EM\_OE}}$.
$\overline{\text{EM\_WE}}$	E14	C19	I/O/Z	IPU DV_{DD33}	For EMIFA, it is write enable output $\overline{\text{EM\_WE}}$.
R2/EM_BA[0]/ GP[6]/(AEM1)	C17	E20	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between VPBE (VENC), EMIFA, and GPIO. For EMIFA, this is the Bank Address 0 output (EM_BA[0]). When connected to an 8-bit asynchronous memory, this pin is the lowest order bit of the byte address.
B2/EM_BA[1]/ GP[5]/(AEM0)	C16	C20	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between VPBE (VENC), EMIFA, and GPIO. For EMIFA, this is the Bank Address 1 output EM_BA[1]. When connected to an 8-bit asynchronous memory, this pin is the 2nd bit of the address.

(1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal
(2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see Section 3.9.1, *Pullup/Pulldown Resistors*.
(3) Specifies the operating I/O supply voltage for each signal

Table 2-11. EMIFA Terminal Functions (EMIFA Pinout Mode 3, AEM[2:0] = 011)

SIGNAL			TYPE(1)	OTHER(2)(3)	DESCRIPTION
NAME	ZWT NO.	ZDU NO.			
EMIFA FUNCTIONAL PINS: 8-Bit ASYNC/NOR with Reduced Address Reach (EMIFA Pinout Mode 3, AEM[2:0] = 011)					
Actual pin functions are determined by the PINMUX0 and PINMUX1 register bit settings (e.g., PCIEN, AEAW[2:0], AEM[2:0], etc.). For more details, see Section 3.7, *Multiplexed Pin Configurations*.					
G0/EM_CS2/ GP[12]	C19	C22	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between VPBE (VENC), EMIFA, and GPIO. For EMIFA, this pin is Chip Select 2 output EM_CS2 for use with asynchronous memories (i.e., NOR flash). This is the chip select for the default boot and ROM boot modes. ***Note:*** This pin features an internal pulldown (IPD). If this pin is connected and used as an EMIFA chip select signal, for proper device operation, an external pullup resistor ***must*** be used to ensure the EM_CSx function defaults to an inactive (high) state.
LCD_OE/EM_CS3/ GP[13]	C18	D22	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between VPBE (VENC), EMIFA, and GPIO. For EMIFA, this pin is Chip Select 3 output EM_CS3 for use with asynchronous memories (i.e., NOR flash). ***Note:*** This pin features an internal pulldown (IPD). If this pin is connected and used as an EMIFA chip select signal, for proper device operation, an external pullup resistor ***must*** be used to ensure the EM_CSx function defaults to an inactive (high) state.
VSYNC/EM_CS4/ GP[32]	E19	H22	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between VPBE (VENC), EMIFA, and GPIO. For EMIFA, it is Chip Select 4 output EM_CS4 for use with asynchronous memories (i.e., NOR flash). ***Note:*** This pin features an internal pulldown (IPD). If this pin is connected and used as an EMIFA chip select signal, for proper device operation, an external pullup resistor ***must*** be used to ensure the EM_CSx function defaults to an inactive (high) state.
HSYNC/EM_CS5/ GP[33]	F19	J22	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between VPBE (VENC), EMIFA, and GPIOD. For EMIFA, it is Chip Select 5 output EM_CS5 for use with asynchronous memories (i.e., NOR flash). ***Note:*** This pin features an internal pulldown (IPD). If this pin is connected and used as an EMIFA chip select signal, for proper device operation, an external pullup resistor ***must*** be used to ensure the EM_CSx function defaults to an inactive (high) state.
EM_R/W/ GP[35]	D13	C17	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between EMIFA and GPIO. For EMIFA, it is read/write output EM_R/W.
EM_WAIT/ (RDY/BSY)	E15	D20	I/O/Z	IPU DV_{DD33}	For EMIFA (ASYNC/NOR), this pin is wait state extension input EM_WAIT.
EM_OE	D15	D19	I/O/Z	IPU DV_{DD33}	For EMIFA, it is output enable output EM_OE.
EM_WE	E14	C19	I/O/Z	IPU DV_{DD33}	For EMIFA, it is write enable output EM_WE.
R2/EM_BA[0]/ GP[6]/(AEM1)	C17	E20	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between VPBE (VENC), EMIFA, and GPIO. For EMIFA, this is the Bank Address 0 output (EM_BA[0]). When connected to an 8-bit asynchronous memory, this pin is the lowest order bit of the byte address.
B2/EM_BA[1]/ GP[5]/(AEM0)	C16	C20	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between VPBE (VENC), EMIFA, and GPIO. For EMIFA, this is the Bank Address 1 output EM_BA[1]. When connected to an 8-bit asynchronous memory, this pin is the 2nd bit of the address.

(1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal
(2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see Section 3.9.1, *Pullup/Pulldown Resistors*.
(3) Specifies the operating I/O supply voltage for each signal

Table 2-16. EMAC and MDIO Terminal Functions

SIGNAL NAME	SIGNAL ZWT NO.	SIGNAL ZDU NO.	TYPE[1]	OTHER[2][3]	DESCRIPTION
EMAC					
HCNTL1/MTXEN/ AD11/GP[75]	D3	C4	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between HPI, Ethernet MAC (EMAC), PCI, and GPIO. In Ethernet MAC mode, it is Transmit Enable output MTXEN.
HD15/MTXCLK/ AD12/GP[73]	A4	A4	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between HPI, Ethernet MAC (EMAC), PCI, and GPIO. In Ethernet MAC mode, it is Transmit Clock input MTXCLK.
$\overline{\text{HD9}}$/MCOL/ $\overline{\text{PSTOP}}$/GP[67]	C6	C6	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between HPI, Ethernet MAC (EMAC), PCI, and GPIO. In Ethernet MAC mode, it is Collision Detect input MCOL.
$\overline{\text{HD11}}$/MTXD3/ $\overline{\text{PCBE1}}$/GP[69]	C5	A5	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between HPI, Ethernet MAC (EMAC), PCI, and GPIO. In Ethernet MAC mode, it is Transmit Data 3 output MTXD3.
HD12/MTXD2/ PPAR/GP[70]	D5	C5	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between HPI, Ethernet MAC (EMAC), PCI, and GPIO. In Ethernet MAC mode, it is Transmit Data 2 output MTXD2.
HD13/MTXD1/ AD14/GP[71]	B4	B4	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between HPI, Ethernet MAC (EMAC), PCI, and GPIO. In Ethernet MAC mode, it is Transmit Data 1 output MTXD1.
HD14/MTXD0/ AD15/GP[72]	D4	B5	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between HPI, Ethernet MAC (EMAC), PCI, and GPIO. In Ethernet MAC mode, it is Transmit Data 0 output MTXD0.
HR/$\overline{\text{W}}$/MRXCLK/ AD8/GP[77]	A3	A3	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between HPI, Ethernet MAC (EMAC), PCI, and GPIO. In Ethernet MAC mode, it is Receive Clock input MRXCLK.
HHWIL/MRXDV/ AD13/GP[74]	C4	D3	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between HPI, Ethernet MAC (EMAC), PCI, and GPIO. In Ethernet MAC mode, it is Receive Data Valid input MRXDV.
HCNTL0/MRXER/ AD10/GP[76]	B3	B2	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between HPI, Ethernet MAC (EMAC), PCI, and GPIO. In Ethernet MAC mode, it is Receive Error input MRXER.
$\overline{\text{HD10}}$/MCRS/ $\overline{\text{PSERR}}$/GP[68]	B5	B6	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between HPI, Ethernet MAC (EMAC), PCI, and GPIO. In Ethernet MAC mode, it is Carrier Sense input MCRS.
$\overline{\text{HINT}}$/MRXD3/ AD6/GP[82]	C2	D2	I/O/Z	IPU DV_{DD33}	This pin is multiplexed between HPI, Ethernet MAC (EMAC), PCI, and GPIO. In Ethernet MAC mode, it is Receive Data 3 input MRXD3.
$\overline{\text{HRDY}}$/MRXD2/ $\overline{\text{PCBE0}}$/GP[80]	D2	C3	I/O/Z	IPU DV_{DD33}	This pin is multiplexed between HPI, Ethernet MAC (EMAC), PCI, and GPIO. In Ethernet MAC mode, it is Receive Data 2 input MRXD2.
$\overline{\text{HDS1}}$/MRXD1/ AD7/GP[79]	B2	B3	I/O/Z	IPU DV_{DD33}	This pin is multiplexed between HPI, Ethernet MAC (EMAC), PCI, and GPIO. In Ethernet MAC mode, it is Receive data 1 input MRXD1.
$\overline{\text{HDS2}}$/MRXD0/ AD9/GP[78]	C3	C2	I/O/Z	IPU DV_{DD33}	This pin is multiplexed between HPI, Ethernet MAC (EMAC), PCI, and GPIO. In Ethernet MAC mode, it is Receive Data 0 input MRXD0.
MDIO					
$\overline{\text{HCS}}$/MDCLK/ AD5/GP[81]	C1	D1	I/O/Z	IPU DV_{DD33}	This pin is multiplexed between HPI, MDIO, PCI, and GPIO. In Ethernet MAC mode, it is Management Data Clock output MDCLK.
$\overline{\text{HAS}}$/MDIO/ AD3/GP[83]	D1	C1	I/O/Z	IPU DV_{DD33}	This pin is multiplexed between HPI, MDIO, PCI, and GPIO. In Ethernet MAC mode, it is Management Data I/O MDIO **(I/O/Z)**.

(1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal
(2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see Section 3.9.1, *Pullup/Pulldown Resistors*.
(3) Specifies the operating I/O supply voltage for each signal

Table 2-17. VLYNQ Terminal Functions

SIGNAL			TYPE[1]	OTHER[2][3]	DESCRIPTION
NAME	ZWT NO.	ZDU NO.			
VLYNQ					
VLYNQ_CLOCK/ PCICLK/GP[57]	A7	A8	I/O/Z	IPU DV_{DD33}	This pin is multiplexed between VLYNQ, PCI, and GPIO. For VLYNQ, it is the clock VLYNQ_CLOCK (I/O/Z).
HD0/VLYNQ_SCRUN/ AD18/GP[58]	C8	B9	I/O/Z	IPU DV_{DD33}	This pin is multiplexed between HPI, VLYNQ, PCI, and GPIO. For VLYNQ, it is the Serial Clock run request VLYNQ_SCRUN (I/O/Z).
HD8/VLYNQ_TXD3/ PPERR/GP[66]	A5	A6	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between HPI, VLYNQ, PCI, and GPIO. For VLYNQ, it is transmit bus bit 3 output VLYNQ_TXD3.
HD7/VLYNQ_TXD2/ PDEVSEL/GP[65]	B6	B7	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between HPI, VLYNQ, PCI, and GPIO. For VLYNQ, it is transmit bus bit 2 output VLYNQ_TXD2.
HD6/VLYNQ_TXD1/ PTRDY/GP[64]	D6	C7	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between HPI, VLYNQ, PCI, and GPIO. For VLYNQ, it is transmit bus bit 1 output VLYNQ_TXD1.
HD5/VLYNQ_TXD0/ PIRDY/GP[63]	A6	A7	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between HPI, VLYNQ, PCI, and GPIO. For VLYNQ, it is transmit bus bit 0 output VLYNQ_TXD0.
HD4/VLYNQ_RXD3/ PFRAME/GP[62]	C7	C8	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between HPI, VLYNQ, PCI, and GPIO. For VLYNQ, it is receive bus bit 3 input VLYNQ_RXD3.
HD3/VLYNQ_RXD2/ PCBE2/GP[61]	B7	B8	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between HPI, VLYNQ, PCI, and GPIO. For VLYNQ, it is receive bus bit 2 input VLYNQ_RXD2.
HD2/VLYNQ_RXD1/ AD17/GP[60]	A8	A9	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between HPI, VLYNQ, PCI, and GPIO. For VLYNQ, it is receive bus bit 1 input VLYNQ_RXD1.
HD1/VLYNQ_RXD0/ AD16/GP[59]	D7	C9	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between HPI, VLYNQ, PCI, and GPIO. For VLYNQ, it is receive bus bit 0 input VLYNQ_RXD0.

(1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal
(2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see Section 3.9.1, *Pullup/Pulldown Resistors*.
(3) Specifies the operating I/O supply voltage for each signal

Table 2-18. Host-Port Interface Terminal Functions

SIGNAL			TYPE[1]	OTHER[2][3]	DESCRIPTION
NAME	ZWT NO.	ZDU NO.			
Host-Port Interface (HPI)					
HD0/VLYNQ_SCRUN/ AD18/GP[58]	C8	B9	I/O/Z	IPU DV_{DD33}	This pin is multiplexed between HPI, VLYNQ or EMAC, PCI, and GPIO. In HPI mode, these pins are host-port data pins HD[15:0] (**I/O/Z**) and are multiplexed internally with the HPI address lines.
HD1/VLYNQ_RXD0/ AD16/GP[59]	D7	C9		IPD DV_{DD33}	
HD2/VLYNQ_RXD1/ AD17/GP[60]	A8	A9			
HD3/VLYNQ_RXD2/ PCBE2/GP[61]	B7	B8			
HD4/VLYNQ_RXD3/ PFRAME/GP[62]	C7	C8			
HD5/VLYNQ_TXD0/ PIRDY/GP[63]	A6	A7			
HD6/VLYNQ_TXD1/ PTRDY/GP[64]	D6	C7			
HD7/VLYNQ_TXD2/ PDEVSEL/GP[65]	B6	B7			
HD8/VLYNQ_TXD3/ PPERR/GP[66]	A5	A6			
HD9/MCOL/ PSTOP/GP[67]	C6	C6			
HD10/MCRS/ PSERR/GP[68]	B5	B6			
HD11/MTXD3/ PCBE1/GP[69]	C5	A5			
HD12/MTXD2/ PPAR/GP[70]	D5	C5			
HD13/MTXD1/ AD14/GP[71]	B4	B4			
HD14/MTXD0/ AD15/GP[72]	D4	B5			
HD15/MTXCLK/ AD12/GP[73]	A4	A4			
HHWIL/MRXDV/ AD13/GP[74]	C4	D3	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between HPI, EMAC, PCI, and GPIO. In HPI mode, this pin is half-word identification input HHWIL (**I**).
HCNTL1/MTXEN/ AD11/GP[75]	D3	C4	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between HPI, EMAC, PCI, and GPIO. In HPI mode, this pin is control input 1 HCNTL1 (**I**). The state of HCNTL1 and HCNTL0 determines if address, data, or control information is being transmitted between an external host and the DM6433.
HCNTL0/MRXER/ AD10/GP[76]	B3	B2	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between HPI, EMAC, PCI, and GPIO. In HPI mode, this pin is control input 0 HCNTL0 (**I**). The state of HCNTL1 and HCNTL0 determines if address, data, or control information is being transmitted between an external host and the DM6433.
HR/W/MRXCLK/ AD8/GP[77]	A3	A3	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between HPI, EMAC, PCI, and GPIO. In HPI mode, this pin is host read or write select input HR/W(**I**).
HDS2/MRXD0/ AD9/GP[78]	C3	C2	I/O/Z	IPU DV_{DD33}	This pin is multiplexed between HPI, EMAC, PCI, and GPIO. In HPI mode, this pin is host data strobe input 2 HDS2 (**I**).

(1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal
(2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see Section 3.9.1, *Pullup/Pulldown Resistors*.
(3) Specifies the operating I/O supply voltage for each signal

Table 2-18. Host-Port Interface Terminal Functions (continued)

SIGNAL			TYPE[1]	OTHER[2][3]	DESCRIPTION
NAME	ZWT NO.	ZDU NO.			
$\overline{\text{HDS1}}$/MRXD1/ AD7/GP[79]	B2	B3	I/O/Z	IPU DV_{DD33}	This pin is multiplexed between HPI, EMAC, PCI, and GPIO. In HPI mode, this pin is host data strobe input 1 $\overline{\text{HDS1}}$ (**I**).
$\overline{\text{HRDY}}$/MRXD2/ $\overline{\text{PCBE0}}$/GP[80]	D2	C3	I/O/Z	IPU DV_{DD33}	This pin is multiplexed between HPI, EMAC, PCI, and GPIO. In HPI mode, this pin is host ready output from DSP to host (**O/Z**).
$\overline{\text{HCS}}$/MDCLK/ AD5/GP[81]	C1	D1	I/O/Z	IPU DV_{DD33}	This pin is multiplexed between HPI, MDIO, PCI, and GPIO. In HPI mode, this pin is HPI active low chip select input $\overline{\text{HCS}}$ (**I**).
$\overline{\text{HINT}}$/RXD3/ AD6/GP[82]	C2	D2	I/O/Z	IPU DV_{DD33}	This pin is multiplexed between HPI, EMAC, PCI, and GPIO. In HPI mode, this pin is host interrupt output $\overline{\text{HINT}}$ (**O/Z**).
$\overline{\text{HAS}}$/MDIO/ AD3/GP[83]	D1	C1	I/O/Z	IPU DV_{DD33}	This pin is multiplexed between HPI, MDIO, PCI, and GPIO. In HPI mode, this pin is host address strobe $\overline{\text{HAS}}$ (**I**). For proper HPI operation, if this pin is routed out, it ***must be*** pulled up via an external resistor.

Table 2-19. VPBE Terminal Functions

SIGNAL			TYPE[1]	OTHER[2][3]	DESCRIPTION
NAME	ZWT NO.	ZDU NO.			
VIDEO OUT (VPBE)					
HSYNC/$\overline{\text{EM\_CS5}}$/ GP[33]	F19	J22	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between VPBE, EMIFA, and GPIO. In VPBE mode, this pin is the VPBE Horizontal Sync (I/O/Z).
VSYNC/$\overline{\text{EM\_CS4}}$/ GP[32]	E19	H22	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between VPBE, EMIFA, and GPIO. In VPBE mode, this pin is the VPBE Vertical Sync (I/O/Z).
VCLK/GP[31]	D19	G22	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between VPBE and GPIO. In VPBE mode, this pin is the VPBE Clock Output.
VPBECLK/GP[30]	G19	K22	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between VPBE and GPIO. In VPBE mode, this pin is the VPBE Clock Input.
COUT0/EM_D[0]/ GP[14]	D16	E21	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between VPBE (VENC), EMIFA, and GPIO. In VPBE mode, this pin is the video encoder (VENC) output COUT0.
COUT1/EM_D[1]/ GP[15]	D18	G20	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between VPBE(VENC), EMIFA, and GPIO. In VPBE mode, this pin is the video encoder (VENC) output COUT1.
COUT2/EM_D[2]/ GP[16]	D17	E22	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between VPBE(VENC), EMIFA, and GPIO. In VPBE mode, this pin is the video encoder (VENC) output COUT2.
COUT3/EM_D[3]/ GP[17]	E16	F20	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between VPBE(VENC), EMIFA, and GPIO. In VPBE mode, this pin is the video encoder (VENC) output COUT3.
COUT4/EM_D[4]/ GP[18]	E18	G21	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between VPBE(VENC), EMIFA, and GPIO. In VPBE mode, this pin is the video encoder (VENC) output COUT4.
COUT5/EM_D[5]/ GP[19]	E17	F22	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between VPBE(VENC), EMIFA, and GPIO. In VPBE mode, this pin is the video encoder (VENC) output COUT5.
COUT6/EM_D[6]/ GP[20]	F16	F21	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between VPBE(VENC), EMIFA, and GPIO. In VPBE mode, this pin is the video encoder (VENC) output COUT6.
COUT7/EM_D[7]/ GP[21]	F17	H20	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between VPBE (VENC), EMIFA, and GPIO. In VPBE mode, this pin is the video encoder (VENC) output COUT7.
YOUT0/GP[22]/ (BOOTMODE0)	F18	J20	I/O/Z	IPD DV_{DD33}	These pins are multiplexed between VPBE (VENC) and GPIO. After reset, these are video encoder (VENC) outputs 6:0, YOUT[6:0]. For proper DM6433 device operation, the YOUT6 pin ***must*** be pulled down via an external resistor. For proper DM6433 device operation, the YOUT5 pin ***must*** be pulled up via an external resistor.
YOUT1/GP[23]/ (BOOTMODE1)	F15	K20	I/O/Z	IPD DV_{DD33}	
YOUT2/GP[24]/ (BOOTMODE2)	G15	L20	I/O/Z	IPD DV_{DD33}	
YOUT3/GP[25]/ (BOOTMODE3)	G16	H21	I/O/Z	IPD DV_{DD33}	
YOUT4/GP[26]/ (FASTBOOT)	G17	K19	I/O/Z	IPD DV_{DD33}	
YOUT5/GP[27]	H17	L19	I/O/Z	IPU DV_{DD33}	
YOUT6/ GP[28]	H16	J21	I/O/Z	IPD DV_{DD33}	
YOUT7/ GP[29]	H15	K21	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between VPBE (VENC) and GPIO. In VPBE mode, this pin is the VENC output 7, YOUT7.
LCD_OE/$\overline{\text{EM\_CS3}}$/ GP[13]	C18	D22	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between VPBE, EMIFA, and GPIO. In VPBE mode, it is the LCD output enable LCD_OE (O/Z).
G0/$\overline{\text{EM\_CS2}}$/ GP[12]	C19	C22	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between VPBE, EMIFA, and GPIO. In VPBE mode, this pin is the RGB666/888 Green output data bit 0, G0.
B0/LCD_FIELD/ EM_A[3]/GP[11]	B18	D21	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between VPBE, EMIFA, and GPIO. In VPBE mode, this pin is the RGB666/888 Blue output data bit 0, B0 or LCD interlaced LCD_FIELD (I/O/Z).

(1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal
(2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see Section 3.9.1, *Pullup/Pulldown Resistors*.
(3) Specifies the operating I/O supply voltage for each signal

Table 2-19. VPBE Terminal Functions (continued)

SIGNAL			TYPE[1]	OTHER[2][3]	DESCRIPTION
NAME	ZWT NO.	ZDU NO.			
R0/EM_A[4]/ GP[10]/ (AEAW2/PLLMS2)	A17	B21	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between VPBE, EMIFA, and GPIO. In VPBE mode, this pin is the RGB666/888 Red output data bit 0, R0.
G1/EM_A[1]/ (ALE)/GP[9]/ (AEAW1/PLLMS1)	A16	B20	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between VPBE, EMIFA, and GPIO. In VPBE mode, this pin is the RGB666/888 Green output data bit 1, G1.
B1/EM_A[2]/ (CLE)/GP[8]/ (AEAW0/PLLMS0)	B16	A20	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between VPBE, EMIFA, and GPIO. In VPBE mode, this pin is the RGB666/888 Blue output data bit 1, B1.
R1/EM_A[0]/ GP[7]/(AEM2)	B17	C21	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between VPBE, EMIFA, and GPIO. In VPBE mode, this pin is the RGB666/888 Red output data bit 1, R1.
R2/EM_BA[0]/ GP[6]/(AEM1)	C17	E20	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between VPBE, EMIFA, and GPIO. In VPBE mode, this pin is the RGB666/888 Red output data bit 2, R2.
B2/EM_BA[1]/ GP[5]/(AEM0)	C16	C20	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between VPBE, EMIFA, and GPIO. In VPBE mode, this pin is the RGB666/888 Blue output data bit 2, B2.

Table 2-20. DAC [Part of VPBE] Terminal Functions

SIGNAL			TYPE[1]	OTHER[2][3]	DESCRIPTION
NAME	ZWT NO.	ZDU NO.			
DAC[A:D]					
DAC_VREF	N19	V22	A I	[3]	Reference voltage input (0.5 V) **Note:** If the DAC peripheral is not being used, for proper device operation, this pin must be tied directly to V_{SS}.
DAC_IOUT_A	P19	V21	A O		Output of DAC A **Note:** If the DAC peripheral is not being used, for proper device operation, this pin must be left unconnected.
DAC_IOUT_B	P18	U22	A O		Output of DAC B **Note:** If the DAC peripheral is not being used, for proper device operation, this pin must be left unconnected.
DAC_IOUT_C	N18	T21	A O		Output of DAC C **Note:** If the DAC peripheral is not being used, for proper device operation, this pin must be left unconnected.
DAC_IOUT_D	N17	T22	A O		Output of DAC D **Note:** If the DAC peripheral is not being used, for proper device operation, this pin must be left unconnected.
V_{DDA_1P8V}	P17	V20	S	[3]	1.8 V Analog I/O power **Note:** If the DAC peripheral is not being used, for proper device operation, this pin must be tied directly to V_{SS}.
V_{SSA_1P8V}	P16	U20	GND	[3]	Analog I/O ground **Note:** If the DAC peripheral is not being used, for proper device operation, this pin must be tied directly to V_{SS}.
V_{DDA_1P1V}	N15	T20	S	[3]	1.20 V Analog core supply voltage (-7/-6/-5/-4/-L/-Q6/-Q5/-Q4 devices) 1.05 V Analog core supply voltage (-7/-6/-5/-4/-L/-Q5 devices) **Note:** If the DAC peripheral is not being used, for proper device operation, this pin must be tied directly to V_{SS}.
V_{SSA_1P1V}	P15	T19	GND	[3]	Analog core ground **Note:** If the DAC peripheral is not being used, for proper device operation, this pin must be tied directly to V_{SS}.
DAC_RBIAS	N16	U21	A I	[3]	External resistor connection for current bias configuration. This must be connected via a 4 kΩ resistor to V_{SSA_1P8V}. **Note:** If the DAC peripheral is not being used, for proper device operation, this pin must be tied directly to V_{SS}.

(1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal
(2) Specifies the operating I/O supply voltage for each signal
(3) For more information, see the *Recommended Operating Conditions* table

Table 2-21. I2C Terminal Functions

SIGNAL			TYPE(1)	OTHER(2)(3)	DESCRIPTION
NAME	ZWT NO.	ZDU NO.			
I2C					
SCL	M2	N2	I/O/Z	DV_{DD33}	For I2C, this pin is I2C clock. In I2C master mode, this pin is an output. In I2C slave mode, this pin is an input. When the I2C module is used, for proper device operation, this pin ***must*** be pulled up via an external resistor.
SDA	M3	P2	I/O/Z	DV_{DD33}	For I2C, this pin is the I2C bi-directional data signal. When the I2C module is used, for proper device operation, this pin ***must*** be pulled up via an external resistor.

(1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal
(2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see Section 3.9.1, *Pullup/Pulldown Resistors*.
(3) Specifies the operating I/O supply voltage for each signal

Table 2-22. Multichannel Buffered Serial Port 0 (McBSP0) Terminal Functions

SIGNAL			TYPE[1]	OTHER[2][3]	DESCRIPTION
NAME	ZWT NO.	ZDU NO.			
Multichannel Buffered Serial Port 0 (McBSP0)					
For more details on pin multiplexing, see Section 3.7, *Multiplexed Pin Configurations*.					
CLKS0/TOUT0L/ GP[97]	J4	L3	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between McBSP0, Timer0, and GPIO. For McBSP0, it is McBSP0 external clock source (I).
ACLKR0/CLKX0/ GP[99]	H1	J1	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between McASP0, McBSP0, and GPIO. For McBSP0, it is McBSP0 transmit clock CLKX0 (I/O/Z).
AHCLKR0/CLKR0/ GP[101]	J2	K1	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between McASP0, McBSP0, and GPIO. For McBSP0, it is McBSP0 receive clock CLKR0 (I/O/Z).
AXR0[2]/FSX0/ GP[103]	H3	J2	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between McASP0, McBSP0, and GPIO. For McBSP0, it is McBSP0 transmit frame synchronization FSX0 (I/O/Z).
AXR0[3]/FSR0/ GP[102]	G4	J3	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between McASP0, McBSP0, and GPIO. For McBSP0, it is McBSP0 receive frame synchronization FSR0 (I/O/Z).
AXR0[1]/DX0/ GP[104]	J3	K2	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between McASP0, McBSP0, and GPIO. For McBSP0, it is McBSP0 data transmit output DX0 (O/Z).
AFSR0/DR0/ GP[100]	H4	K3	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between McASP0, McBSP0, and GPIO. For McBSP0, it is McBSP0 data receive input DR0 (I).

(1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal
(2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see Section 3.9.1, *Pullup/Pulldown Resistors*.
(3) Specifies the operating I/O supply voltage for each signal

Table 2-23. Multichannel Audio Serial Port (McASP0) Terminal Functions

SIGNAL			TYPE(1)	OTHER(2)(3)	DESCRIPTION
NAME	ZWT NO.	ZDU NO.			
McASP0					
AMUTEIN0/ GP[109]	F2	G3	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between McASP0 and GPIO. For McASP0, it is McASP0 mute input AMUTEIN0 (I).
AMUTE0/GP[110]	G3	H3	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between McASP0 and GPIO. For McASP0, it is McASP0 mute output AMUTE0 (O/Z).
ACLKR0/CLKX0/ GP[99]	H1	J1	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between McASP0, McBSP0, and GPIO. For McASP0, it is McASP0 receive bit clock ACLKR0 (I/O/Z).
AHCLKR0/CLKR0/ GP[101]	J2	K1	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between McASP0, McBSP0, and GPIO. For McASP0, it is McASP0 receive high-frequency master clock AHCLKR0 (I/O/Z).
ACLKX0/GP[106]	F1	G1	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between McASP0 and GPIO. For McASP0, it is McASP0 transmit bit clock ACLKX0 (I/O/Z).
AHCLKX0/GP[108]	G1	H1	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between McASP0 and GPIO. For McASP0, it is McASP0 transmit high-frequency master clock AHCLKX0 (I/O/Z).
AFSR0/DR0/ GP[100]	H4	K3	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between McASP0, McBSP0, and GPIO. For McASP0, it is McASP0 receive frame synchronization AFSR0 (I/O/Z).
AFSX0/GP[107]	G2	G2	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between McASP0 and GPIO. For McASP0, it is McASP0 transmit frame synchronization AFSX0 (I/O/Z).
AXR0[3]/FSR0/ GP[102]	G4	J3	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between McASP0, McBSP0, and GPIO. For McASP0, it is McASP0 transmit/receive (TX/RX) data pin 3 AXR0[3] (I/O/Z).
AXR0[2]/FSX0/ GP[103]	H3	J2	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between McASP0, McBSP0, and GPIO. For McASP0, it is McASP0 transmit/receive (TX/RX) data pin 2 AXR0[2] (I/O/Z).
AXR0[1]/DX0/ GP[104]	J3	K2	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between McASP0, McBSP0, and GPIO. For McASP0, it is McASP0 transmit/receive (TX/RX) data pin 1 AXR0[1] (I/O/Z).
AXR0[0]/GP[105]	H2	H2	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between McASP0 and GPIO. For McASP0, it is McASP0 transmit/receive (TX/RX) data pin 0 AXR0[0] (I/O/Z).

(1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal
(2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see Section 3.9.1, *Pullup/Pulldown Resistors*.
(3) Specifies the operating I/O supply voltage for each signal

Table 2-24. UART0 Terminal Functions

SIGNAL			TYPE(1)	OTHER(2)(3)	DESCRIPTION
NAME	ZWT NO.	ZDU NO.			
UART0					
URXD0/ GP[85]	L2	M2	I/O/Z	IPU DV_{DD33}	This pin is multiplexed between UART0 (Data) and GPIO. When used by UART0 this pin is the receive data input URXD0.
UTXD0/ GP[86]	K3	N1	I/O/Z	IPU DV_{DD33}	This pin is multiplexed between UART0 (Data) and GPIO. In UART0 mode, this pin is the transmit data output UTXD0.
UCTS0 GP[87]	L1	P1	I/O/Z	IPU DV_{DD33}	This pin is multiplexed between the UART0 (Flow Control) and GPIO. In UART0 mode, this pin is the clear to send input UCTS0.
URTS0 PWM0 GP[88]	L3	M3	I/O/Z	IPU DV_{DD33}	This pin is multiplexed between the UART0 (Flow Control), PWM0, and GPIO. In UART0 mode, this pin is the ready to send output URTS0.

(1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal
(2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see Section 3.9.1, *Pullup/Pulldown Resistors*.
(3) Specifies the operating I/O supply voltage for each signal

Table 2-25. PWM0, PWM1, and PWM2 Terminal Functions

SIGNAL			TYPE(1)	OTHER(2)(3)	DESCRIPTION
NAME	ZWT NO.	ZDU NO.			
PWM2					
CLKOUT0/PWM2/ GP[84]	M1	R1	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between the System Clock generator (PLL1), PWM2, and GPIO. For PWM2, this pin is output PWM2.
PWM1					
GP[4]/PWM1	F3	F3	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between GPIO and PWM1. For PWM1, this pin is output PWM1.
PWM0					
URTS0/PWM0/ GP[88]	L3	M3	I/O/Z	IPU DV_{DD33}	This pin is multiplexed between the UART0 (Flow Control), PWM0, and GPIO. For PWM0, this pin is output PWM0.

(1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal
(2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see Section 3.9.1, *Pullup/Pulldown Resistors*.
(3) Specifies the operating I/O supply voltage for each signal

Table 2-26. Timer 0, Timer 1, and Timer 2 Terminal Functions

SIGNAL			TYPE(1)	OTHER(2)(3)	DESCRIPTION
NAME	ZWT NO.	ZDU NO.			
Timer 2					
No external pins. The Timer 2 (watchdog) peripheral pins are not pinned out as external pins.					
Timer 1					
TINP1L/ GP[56]	L4	P3	I/O/Z	IPU DV_{DD33}	This pin is multiplexed between the Timer 1 and GPIO. For Timer 1, this pin is the timer 1 input pin for the lower 32-bit counter
TOUT1L/ GP[55]	K4	N3	I/O/Z	IPU DV_{DD33}	This pin is multiplexed between the Timer 1 and GPIO. For Timer 1, this pin is the timer 1 output pin for the lower 32-bit counter
Timer 0					
TINP0L/ GP[98]	K2	L2	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between the Timer 0 and GPIO. For Timer 0, this pin is the timer 0 input pin for the lower 32-bit counter
CLKS0/ TOUT0L/ GP[97]	J4	L3	I/O/Z	IPD DV_{DD33}	This pin is multiplexed between the McBSP0, Timer 0, and GPIO. For Timer 0, this pin is the timer 0 output pin for the lower 32-bit counter

(1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal
(2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see Section 3.9.1, *Pullup/Pulldown Resistors*.
(3) Specifies the operating I/O supply voltage for each signal

Table 2-27. GPIO Terminal Functions

SIGNAL			TYPE(1)	OTHER(2)(3)	DESCRIPTION
NAME	ZWT NO.	ZDU NO.			
GPIO					
100 out of 111 GPIO pins on the DM6433 device are multiplexed with other peripherals pin functions (e.g., VPBE, PCI, HPI, VLYNQ, EMAC/MDIO, McASP0, McBSP0, Timer 0, Timer 1, UART0, PWM0, PWM1, PWM2, EMIFA, and the CLKOUT0 pin), see the peripheral-specific Terminal Functions tables for the GPIO multiplexing.					

(1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal
(2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see Section 3.9.1, *Pullup/Pulldown Resistors*.
(3) Specifies the operating I/O supply voltage for each signal

Table 2-28. Standalone GPIO 3.3 V Terminal Functions

SIGNAL			TYPE[1]	OTHER[2][3]	DESCRIPTION
NAME	ZWT NO.	ZDU NO.			
Standalone GPIO 3.3 V					
GP[36]	C15	B19	I/O/Z	IPD DV_{DD33}	This pin functions as standalone GPIO pin 36.
GP[37]	B15	B18	I/O/Z	IPD DV_{DD33}	This pin functions as standalone GPIO pin 37.
GP[38]	C14	B17	I/O/Z	IPD DV_{DD33}	This pin functions as standalone GPIO pin 38.
GP[39]	B14	A16	I/O/Z	IPD DV_{DD33}	This pin functions as standalone GPIO pin 39.
GP[40]	D14	C18	I/O/Z	IPD DV_{DD33}	This pin functions as standalone GPIO pin 40.
GP[41]	C13	B16	I/O/Z	IPD DV_{DD33}	This pin functions as standalone GPIO pin 41.
GP[42]	B13	B15	I/O/Z	IPD DV_{DD33}	This pin functions as standalone GPIO pin 42.
GP[43]	A12	A15	I/O/Z	IPD DV_{DD33}	This pin functions as standalone GPIO pin 43.
GP[52]	A15	A19	I/O/Z	IPD DV_{DD33}	This pin functions as standalone GPIO pin 52.
GP[53]	A13	A17	I/O/Z	IPD DV_{DD33}	This pin functions as standalone GPIO pin 53.
GP[54]	A14	A18	I/O/Z	IPD DV_{DD33}	This pin functions as standalone GPIO pin 54.

(1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal
(2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see Section 3.9.1, *Pullup/Pulldown Resistors*.
(3) Specifies the operating I/O supply voltage for each signal

2.7 Device Support

2.7.1 Development Support

TI offers an extensive line of development tools for the TMS320DM643x DMP platform, including tools to evaluate the performance of the processors, generate code, develop algorithm implementations, and fully integrate and debug software and hardware modules. The tool's support documentation is electronically available within the Code Composer Studio™ Integrated Development Environment (IDE).

The following products support development of TMS320DM643x DMP-based applications:

Software Development Tools:

Code Composer Studio™ Integrated Development Environment (IDE): including Editor

C/C++/Assembly Code Generation, and Debug plus additional development tools

Scalable, Real-Time Foundation Software (DSP/BIOS™), which provides the basic run-time target software needed to support any SoC application.

Hardware Development Tools:

Extended Development System (XDS™) Emulator (supports TMS320DM643x DMP multiprocessor system debug) EVM (Evaluation Module)

For a complete listing of development-support tools for the TMS320DM643x DMP platform, visit the Texas Instruments web site on the Worldwide Web at http://www.ti.com uniform resource locator (URL). For information on pricing and availability, contact the nearest TI field sales office or authorized distributor.

2.8 Device and Development-Support Tool Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all DSP devices and support tools. Each DSP commercial family member has one of three prefixes: TMX, TMP, or TMS (e.g., **TMS320DM6433ZWTQ6**). Texas Instruments recommends two of three possible prefix designators for its support tools: TMDX and TMDS. These prefixes represent evolutionary stages of product development from engineering prototypes (TMX/TMDX) through fully qualified production devices/tools (TMS/TMDS).

Device development evolutionary flow:

TMX Experimental device that is not necessarily representative of the final device's electrical specifications.

TMP Final silicon die that conforms to the device's electrical specifications but has not completed quality and reliability verification.

TMS Fully-qualified production device.

Support tool development evolutionary flow:

TMDX Development-support product that has not yet completed Texas Instruments internal qualification testing.

TMDS Fully qualified development-support product.

TMX and TMP devices and TMDX development-support tools are shipped against the following disclaimer:

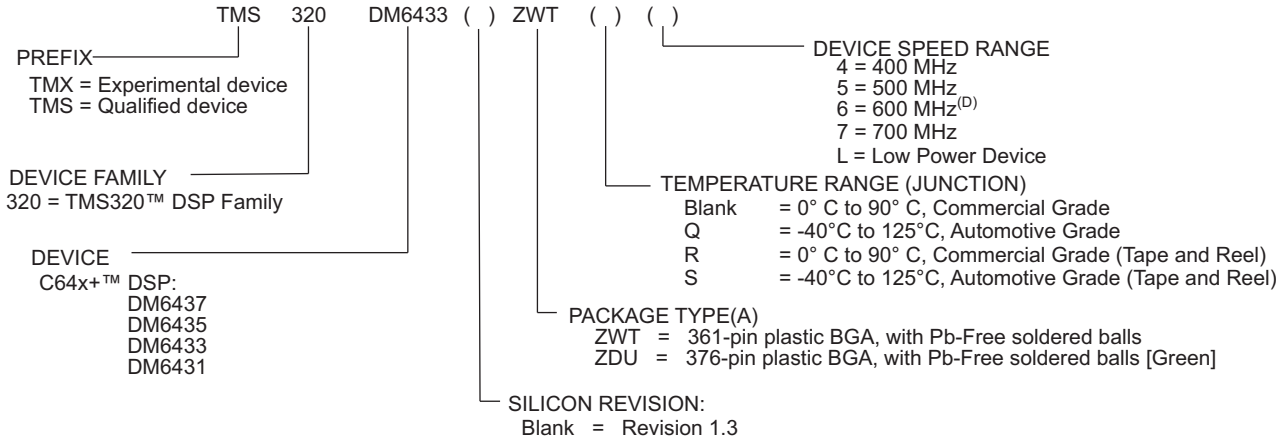
"Developmental product is intended for internal evaluation purposes."

TMS devices and TMDS development-support tools have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (TMX or TMP) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the package type (for example, ZWT), the temperature range (for example, "Blank" is the commercial temperature range), and the device speed range in megahertz (for example, "6" indicates [600-MHz]).

Figure 2-10 provides a legend for reading the complete device name for any TMS320DM643x DMP platform member.



A. BGA = Ball Grid Array
B. For “TMX” initial devices, the device number is DM6437.
C. Not all combinations are available. For more information, see the *Orderable Devices* table in the Packing Information section.
D. The maximum CPU frequency for the -Q6 device is 660 MHz. See the *PLL1 and PLL2* section for maximum operating frequencies of the PLL1 controller.
E. The device speed range symbolization indicates the maximum CPU frequency when the core voltage (CV_{DD}) is set to 1.2 V. To determine the maximum CPU frequency the core voltage is set to 1.05V, refer to the *PLL1 and PLL2* section.

Figure 2-10. Device Nomenclature

2.9 Documentation Support

2.9.1 Related Documentation From Texas Instruments

The following documents describe the TMS320DM643x Digital Media Processor (DMP). Copies of these documents are available on the Internet at www.ti.com. *Tip:* Enter the literature number in the search box provided at www.ti.com.

The current documentation that describes the DM643x DMP, related peripherals, and other technical collateral, is available in the C6000 DSP product folder at: www.ti.com/c6000.

SPRU978 ***TMS320DM643x DMP DSP Subsystem Reference Guide.*** Describes the digital signal processor (DSP) subsystem in the TMS320DM643x Digital Media Processor (DMP).

SPRU983 ***TMS320DM643x DMP Peripherals Overview Reference Guide.*** Provides an overview and briefly describes the peripherals available on the TMS320DM643x Digital Media Processor (DMP).

SPRAA84 ***TMS320C64x to TMS320C64x+ CPU Migration Guide.*** Describes migrating from the Texas Instruments TMS320C64x digital signal processor (DSP) to the TMS320C64x+ DSP. The objective of this document is to indicate differences between the two cores. Functionality in the devices that is identical is not included.

SPRU732 ***TMS320C64x/C64x+ DSP CPU and Instruction Set Reference Guide.*** Describes the CPU architecture, pipeline, instruction set, and interrupts for the TMS320C64x and TMS320C64x+ digital signal processors (DSPs) of the TMS320C6000 DSP family. The C64x/C64x+ DSP generation comprises fixed-point devices in the C6000 DSP platform. The C64x+ DSP is an enhancement of the C64x DSP with added functionality and an expanded instruction set.

SPRU871 ***TMS320C64x+ DSP Megamodule Reference Guide.*** Describes the TMS320C64x+ digital signal processor (DSP) megamodule. Included is a discussion on the internal direct memory access (IDMA) controller, the interrupt controller, the power-down controller, memory protection, bandwidth management, and the memory and cache.

3 Device Configurations

3.1 System Module Registers

The system module includes status and control registers required for configuration of the device. Brief descriptions of the various registers are shown in Table 3-1. System Module registers required for device configurations are discussed in the following sections.

Table 3-1. System Module Register Memory Map

HEX ADDRESS RANGE	REGISTER ACRONYM	DESCRIPTION
0x01C4 0000	PINMUX0	Pin Multiplexing Control 0 (see Section 3.7.2.1, *PINMUX0 Register Description*).
0x01C4 0004	PINMUX1	Pin Multiplexing Control 1 (see Section 3.7.2.2, *PINMUX1 Register Description*).
0x01C4 0008	DSPBOOTADDR	DSP Boot Address (see Section 3.4.2.3, *DSPBOOTADDR Register*).
0x01C4 000C	BOOTCMPLT	Boot Complete (see Section 3.4.2.2, *BOOTCMPLT Register*).
0x01C4 0010	–	Reserved
0x01C4 0014	BOOTCFG	Device Boot Configuration (see Section 3.4.2.1, *BOOTCFG Register*).
0x01C4 0018 - 0x01C4 0027	–	Reserved
0x01C4 0028	JTAGID	JTAG ID (see Section 6.23.1, *JTAG ID (JTAGID) Register Description(s)*).
0x01C4 002C	–	Reserved
0x01C4 0030	HPICTL	HPI Control (see Section 3.6.2.1, *HPI Control Register*).
0x01C4 0034	–	Reserved
0x01C4 0038	–	Reserved
0x01C4 003C	MSTPRI0	Bus Master Priority Control 0 (see Section 3.6.1, *Switch Central Resource (SCR) Bus Priorities*).
0x01C4 0040	MSTPRI1	Bus Master Priority Control 1 (see Section 3.6.1, *Switch Central Resource (SCR) Bus Priorities*).
0x01C4 0044	VPSS_CLKCTL	VPSS Clock Control (see Section 3.3.1.2.1, *VPSS Clocks*).
0x01C4 0048	VDD3P3V_PWDN	V_{DD} 3.3-V I/O Powerdown Control (see Section 3.2, *Power Considerations*).
0x01C4 004C	DDRVTPER	DDR2 VTP Enable Register (see Section 6.9.4, *DDR2 Memory Controller*).
0x01C4 0050 - 0x01C4 0080	–	Reserved
0x01C4 0084	TIMERCTL	Timer Control (see Section 3.6.2.2, *Timer Control Register*).
0x01C4 0088	EDMATCCFG	EDMA Transfer Controller Default Burst Size Configuration (see Section 3.6.2.3, *EDMA TC Configuration Register*).
0x01C4 008C	–	Reserved

3.2 Power Considerations

The DM6433 provides several means of managing power consumption.

As described in the Section 6.3.4, *DM6433 Power and Clock Domains*, the DM6433 has one single power domain—the "Always On" power domain. Within this power domain, the DM6433 utilizes local clock gating via the Power and Sleep Controller (PSC) to achieve power savings. For more details on the PSC, see Section 6.3.5, *Power and Sleep Controller (PSC)* and the *TMS320DM643x DMP DSP Subsystem* Reference Guide (literature number SPRU978).

Some of the DM6433 peripherals support additional power saving features. For more details on power saving features supported, see the peripheral-specific reference guides [listed/linked in the *TMS320DM643x DMP Peripherals Overview* Reference Guide (literature number SPRU983).

Most DM6433 3.3-V I/Os can be powered-down to reduce power consumption. The VDD3P3V_PWDN register in the System Module (see Figure 3-1) is used to selectively power down unused 3.3-V I/O pins. For independent control, the 3.3-V I/Os are separated into functional groups—most of which are named according to the pin multiplexing groups (see Table 3-2). For these I/O groups, only the I/O buffers needed for Host/EMIFA Boot or Power-Up Operations are powered up by default (CLKOUT Block, EMIFA/VPSS Block, Host Block, PCI Data Block, and GPIO Block).

Note: To save power, all other I/O buffers are powered down by default. Before using these pins, the user ***must*** program the VDD3P3V_PWDN register to power up the corresponding I/O buffers.

For a list of multiplexed pins on the device and the pin mux group each pin belongs to, see Section 3.7.3.1, *Multiplexed Pins on DM6433*.

Note: The VDD3P3V_PWDN register *only* controls the power to the I/O buffers. The Power and Sleep Controller (PSC) determines the clock/power state of the peripheral.

BIT	NAME	DESCRIPTION
31:14	RESERVED	Reserved. Read-only, writes have no effect.
13	PCIDAT	PCI Data Block I/O Power Down Control. Controls the power of the 3 I/O pins in the PCI Data Block. 0 = I/O pins powered up [**default**]. 1 = I/O pins powered down and not operational. Outputs are 3-stated (**Hi-Z**).
12	EMBK3	EMIFA/VPSS Sub-Block 3 I/O Power Down Control. Controls the power of the 8 I/O pins in the EMIFA/VPSS Sub-Block 3. 0 = I/O pins powered up [**default**]. 1 = I/O pins powered down and ***not*** operational. Outputs are 3-stated (**Hi-Z**).
11	UR0FC	UART0 Flow Control Block I/O Power Down Control. Controls the power of the 2 I/O pins in the UART0 Flow Control Block. 0 = I/O pins powered up. 1 = I/O pins powered down and ***not*** operational. Outputs are 3-stated (**Hi-Z**) [**default**].
10	UR0DAT	UART0 Data Block I/O Power Down Control. Controls the power of the 2 I/O pins in the UART0 Data Block. 0 = I/O pins powered up. 1 = I/O pins powered down and ***not*** operational. Outputs are 3-stated (**Hi-Z**) [**default**].
9	TIMER1	Timer1 Block I/O Power Down Control. Controls the power of the 2 I/O pins in the Timer1 Block. 0 = I/O pins powered up. 1 = I/O pins powered down and ***not*** operational. Outputs are 3-stated (**Hi-Z**) [**default**].
8	TIMER0	Timer0 Block I/O Power Down Control. Controls the power of the 2 I/O pins in the Timer0 Block. 0 = I/O pins powered up. 1 = I/O pins powered down and ***not*** operational. Outputs are 3-stated (**Hi-Z**) [**default**].
7	SP	Serial Port Block I/O Power Down Control. Controls the power of the 12 I/O pins in the Serial Port Block (Serial Port Sub-Block 0 and Serial Port Sub-Block 1). 0 = I/O pins powered up. 1 = I/O pins powered down and ***not*** operational. Outputs are 3-stated (**Hi-Z**) [**default**].
6	PWM1	PWM1 Block I/O Power Down Control. Contros thel power of the 1 I/O pin in the PWM1 Block. 0 = I/O pins powered up. 1 = I/O pins powered down and ***not*** operational. Outputs are 3-stated (**Hi-Z**) [**default**].
5	GPIO	GPIO Block I/O Power Down Control. Controls the power of the 4 I/O pins in the GPIO Block. 0 = I/O pins powered up [**default**]. 1 = I/O pins powered down and ***not*** operational. Outputs are 3-stated (**Hi-Z**).
4	HOST	Host Block I/O Power Down Control. Controls the power of the 27 I/O pins in the Host Block. 0 = I/O pins powered up [**default**]. 1 = I/O pins powered down and ***not*** operational. Outputs are 3-stated (**Hi-Z**).
3	EMBK2	EMIFA/VPSS Sub-Block 2 I/O Power Down Control. Controls the power of the 3 I/O pins in the EMIFA/VPSS Sub-Block 2. 0 = I/O pins powered up [**default**]. 1 = I/O pins powered down and ***not*** operational. Outputs are 3-stated (**Hi-Z**).

(1) For more details on I/O pins belonging to each pin mux block, see Section 3.7, *Multiplexed Pin Configurations*.

Table 3-2. VDD3P3V_PWDN Register Descriptions (continued)

BIT	NAME	DESCRIPTION
2	EMBK1	EMIFA/VPSS Sub-Block 1 I/O Power Down Control. Controls the power of the 29 I/O pins in the EMIFA/VPSS Sub-Block 1. 0 = I/O pins powered up [**default**]. 1 = I/O pins powered down and ***not*** operational. Outputs are 3-stated (**Hi-Z**).
1	EMBK0	EMIFA/VPSS Sub-Block 0 I/O Power Down Control. Controls the power of the 21 I/O pins in the EMIFA/VPSS Sub-Block 0. 0 = I/O pins powered up [**default**]. 1 = I/O pins powered down and ***not*** operational. Outputs are 3-stated (**Hi-Z**).
0	CLKOUT	CLKOUT Block I/O Power Down Control. Controls the power of the 1 I/O pin in the CLKOUT Block. 0 = I/O pins powered up [**default**]. 1 = I/O pins powered down and ***not*** operational. Outputs are 3-stated (**Hi-Z**).

3.3 Clock Considerations

Global device and local peripheral clocks are controlled by the PLL Controllers (PLLC1 and PLLC2) and the Power and Sleep Controller (PSC). In addition, the System Module VPSS_CLKCTL register configures the clock source to the Video Processing Subsystem (VPSS).

3.3.1 Clock Configurations after Device Reset

After device reset, the user is responsible for programming the PLL Controllers (PLLC1 and PLLC2) and the Power and Sleep Controller (PSC) to bring the device up to the desired clock frequency and the desired peripheral clock state (clock gating *or* not).

For additional power savings, some of the DM6433 peripherals support clock gating within the peripheral boundary. For more details on clock gating and power saving features supported by a specific peripheral, see the peripheral-specific reference guides [listed/linked in the *TMS320DM643x DMP Peripherals Overview* Reference Guide (literature number SPRU983)].

3.3.1.1 Device Clock Frequency

The DM6433 defaults to PLL bypass mode. To bring the device up to the desired clock frequency, the user should program PLLC1 and PLLC2 after device reset.

DM6433 supports a FASTBOOT option, where upon exit from device reset the internal bootloader code automatically programs the PLLC1 into PLL mode with a specific PLL multiplier and divider to speed up device boot. While the FASTBOOT option is beneficial for faster boot, the PLL multiplier and divider selected for boot *may not* be the exact frequency desired for the run-time application. It is the user's responsibility to reconfigure PLLC1 after fastboot to bring the device into the desired clock frequency. Section 3.4.1, *Boot Modes* discusses the different fast boot modes in more detail.

The user ***must*** adhere to the various clock requirements when programming the PLLC1 and PLLC2:

- Fixed frequency ratio requirements between CLKDIV1, CLKDIV3, and CLKDIV6 clock domains. For more details on the frequency ratio requirements, see Section 6.3.4, *DM6433 Power and Clock Domains*.
- PLL multiplier and frequency ranges. For more details on PLL multiplier and frequency ranges, see Section 6.7.1, *PLL1 and PLL2*.

3.3.1.2 Module Clock State

The clock and reset state for each of the modules is controlled by the Power and Sleep Controller (PSC). Table 3-3 shows the default state of each module after a device-level global reset. The DM6433 device has four different module states—Enable, Disable, SyncReset, *or* SwRstDisable. For more information on the definitions of the module states, the PSC, and PSC programming, see Section 6.3.5, *Power and Sleep Controller (PSC)* and the *TMS320DM643x DMP DSP Subsystem* Reference Guide (literature number SPRU978).

Table 3-3. DM6433 Default Module States

LPSC #	MODULE NAME	DEFAULT MODULE STATE [PSC Register MDSTATn.STATE]
0	VPSS (Master)	SwRstDisable
1	VPSS (Slave)	SwRstDisable
2	EDMACC	SwRstDisable
3	EDMATC0	SwRstDisable
4	EDMATC1	SwRstDisable
5	EDMATC2	SwRstDisable
6	EMAC Memory Controller	SwRstDisable
7	MDIO	SwRstDisable
8	EMAC	SwRstDisable

28	TIMER1	SwRstDisable
39	C64x+ CPU	Enable

3.3.1.2.1 VPSS Clocks

The Video Processing SubSystem (VPSS) clocks are controlled via the VPSS_CLKCTL register. The VPSS_CLKCTL register format is shown in Figure 3-2 and the bit field descriptions are given in Table 3-4.

Figure 3-2. VPSS_CLKCTL Register— 0x01C4 0044

Table 3-4. VPSS_CLKCTL Register Bit Description

BIT	NAME	DESCRIPTION
31:5	RESERVED	Reserved. Read-only, writes have no effect.
4	DACCLKEN	Video DAC clock enable. 0 = DAC clock disabled [**default**]. 1 = DAC clock enabled.
3	VENCLKEN	Video Encoder clock enable. 0 = VENC clock disabled [**default**]. 1 = VENC clock enabled.
2	RSV	Reserved. For proper device operation, the user ***must*** write 0 to this bit.
1:0	MUXSEL(1)(2)	VPBE (Video Encoder and DAC) clock selection **SETTING** / **VENC CLK** / **DAC CLK** 00 [**default**] / 27 MHz(a) / 27 MHz(a) 01 / 54 MHz(b) / 54 MHz(b) 10 / VPBECLK Input / VPBECLK Input 11 / Reserved / Reserved (a) The 27-MHz clock comes from PLLC1 SYSCLKBP. (b) The 54-MHz clock comes from PLLC2 PLL2_SYSCLK2.

(1) MUXSEL = 00 selects PLLC1 SYSCLKBP as the clock source to the VPBE. The PLLC1 SYSCLKBP is a 27-MHz clock if the following settings are true:

a. MXI/CLKIN clock source is 27 MHz.

b. PLLC1 Bypass Divider Register (BPDIV) is left at the default setting of divide-by-1.

(2) MUXSEL = 01 selects PLLC2 PLL2_SYSCLK2 as the clock source to the VPBE. The PLLC2 PLL2_SYSCLK2 is a 54-MHz clock if the following settings are true:

a. MXI/CLKIN clock source is 27 MHz.

b. PLLC2 is in PLL Mode with multiplier x20 to generate a PLL output clock of 27 MHz x 20 = 540 MHz.

c. PLLDIV2.RATIO is left at the default setting of divide-by-10 to generate SYSCLK2 = 54 MHz.

For more details on the different methods and software sequence to clock (gate) the VPBE components, see the *TMS320DM643x DMP Video Processing Back End (VPBE)* User's Guide (literature number SPRU952).

3.4 Boot Sequence

The boot sequence is a process by which the device's memory is loaded with program and data sections, and by which some of the device's internal registers are programmed with predetermined values. The boot sequence is started automatically after each device-level global reset. For more details on device-level global resets, see Section 6.5, *Reset*.

There are several methods by which the memory and register initialization can take place. Each of these methods is referred to as a boot mode. The boot mode to be used is selected at reset. For more information on the bootmode selections, see Section 3.4.1, *Boot Modes*.

The device is booted through multiple means—primary bootloaders within internal ROM or EMIFA, and secondary user bootloaders from peripherals or external memories. Boot modes, pin configurations, and register configurations required for booting the device, are described in the following subsections.

3.4.1 Boot Modes

The DM6433 boot modes are determined by these device boot and configuration pins. For information on how these pins are sampled at device reset, see Section 6.5.1.2, *Latching Boot and Configuration Pins*.

- BOOTMODE[3:0]
- PCIEN
- FASTBOOT
- AEM[2:0]
- PLLMS[2:0]

Note: The PLLMS[2:0] configuration pins are actually multiplexed with the AEAW[2:0] configuration pins. For more details on the multiplexed AEAW[2:0]/PLLMS[2:0] configuration pins and control, see Section 3.5.1.2, *EMIFA Address Width Selects (AEAW[2:0]) and FASTBOOT PLL Multiplier Selects (PLLMS[2:0])*.

BOOTMODE[3:0] and PCIEN determine the type of boot (e.g., I2C Boot, EMIFA Boot, HPI Boot, or PCI Boot, etc.). FASTBOOT determines if the PLL is enabled during boot to speed up the boot process.

The combination of AEM[2:0] and PLLMS[2:0] is used by bootloader code to determine the PLL multiplier used during fastboot modes (FASTBOOT = 1).

The DM6433 boot modes are grouped into three categories—Non-Fastboot Modes, Fixed-Multiplier Fastboot Modes, and User-Select Multiplier Fastboot Modes.

- **Non-Fastboot Modes (FASTBOOT = 0):** The device operates in default PLL bypass mode during boot. The Non-Fastboot bootmodes available on the DM6433 are shown in Table 3-5.
- **Fixed-Multiplier Fastboot Modes (FASTBOOT = 1, AEM[2:0] = 001b):** The bootloader code speeds up the device during boot according to the fixed PLL multipliers. The Fixed-Multiplier Fastboot bootmodes available on the DM6433 are shown in Table 3-6.

  Note: The PLLMS[2:0] configurations have ***no*** effect on the Fixed-Multiplier Fastboot Modes, as these pins function as AEAW[2:0] to select the EMIFA address width when AEM[2:0] = 001b.
- **User-Select Multiplier Fastboot Modes (FASTBOOT = 1, AEM[2:0] = 000b,011b,100b,101b):** The bootloader code speeds up the device during boot. The PLL multiplier is selected by the user via the PLLMS[2:0] pins. The User-Select Multiplier Fastboot bootmodes available on the DM6433 are shown in Table 3-7.

All other modes ***not*** shown in these tables are reserved and invalid settings.

Table 3-5. Non-Fastboot Modes (FASTBOOT = 0)

DEVICE BOOT AND CONFIGURATION PINS		BOOT DESCRIPTION(1)	DM6433 DMP (Master/Slave)	PLLC1 CLOCK SETTING AT BOOT			DSPBOOTADDR (DEFAULT)(1)
BOOTMODE[3:0]	PCIEN			PLL MODE(2)	CLKDIV1 DOMAIN (SYSCLK1 DIVIDER)	DEVICE FREQUENCY (SYSCLK1)	
0000	0 or 1	No Boot (Emulation Boot)	Master	Bypass	/1	CLKIN	0x0010 0000
0001	0 or 1	Reserved	–	–	–	–	–
0010	0	HPI Boot	Slave	Bypass	/1	CLKIN	0x0010 0000
	1	Reserved	–	–	–	–	–
0011	0 or 1	Reserved	–	–	–	–	–
0100	0 or 1	EMIFA ROM Direct Boot [PLL Bypass Mode]	Master	Bypass	/1	CLKIN	0x4200 000
0101	0 or 1	I2C Boot [STANDARD MODE](3)	Master	Bypass	/1	CLKIN	0x0010 0000
0110	0 or 1	16-bit SPI Boot [McBSP0]	Master	Bypass	/1	CLKIN	0x0010 0000
0111	0 or 1	NAND Flash Boot	Master	Bypass	/1	CLKIN	0x0010 0000
1000	0 or 1	UART Boot without Hardware Flow Control [UART0]	Master	Bypass	/1	CLKIN	0x0010 0000
1001	0 or 1	Reserved	–	–	–	–	–
1010	0 or 1	VLYNQ Boot	Slave	Bypass	/1	CLKIN	0x0010 0000
1011	0 or 1	Reserved	–	–	–	–	–
1100	0 or 1	Reserved	–	–	–	–	–
1101	0 or 1	Reserved	–	–	–	–	–
1110	0 or 1	UART Boot with Hardware Flow Control [UART0]	Master	Bypass	/1	CLKIN	0x0010 0000
1111	0 or 1	24-bit SPI Boot (McBSP0 + GP[97])	Master	Bypass	/1	CLKIN	0x0010 0000

(1) For all boot modes that default to DSPBOOTADDR = 0x0010 0000 (i.e., all boot modes except the EMIFA ROM Direct Boot, BOOTMODE[3:0] = 0100, FASTBOOT = 0), the bootloader code disables all C64x+ cache (L2, L1P, and L1D) so that upon exit from the bootloader code, all C64x+ memories are configured as all RAM. If cache use is required, the application code must explicitly enable the cache. For more information on the bootloader, see the *Using the TMS320DM643x Bootloader* Application Report (literature number SPRAAG0).

(2) The PLL MODE for Non-Fastboot Modes is fixed as shown in this table; therefore, the PLLMS[2:0] configuration pins have no effect on the PLL MODE.

(3) I2C Boot (BOOTMODE[3:0] = 0101b) is *only* available if the MXI/CLKIN frequency is between 21 MHz to 30 MHz. I2C Boot is ***not*** available for MXI/CLKIN frequencies less than 21 MHz.

Table 3-6. Fixed-Multiplier Fastboot Modes (FASTBOOT = 1, AEM[2:0] = 001b)

1110	0 or 1	UART Boot with Hardware Flow Control [UART0]	Master	Table 3-8	/2	Table 3-8	0x0010 0000
1111	0 or 1	24-bit SPI Boot (McBSP0 + GP[97])	Master	x20	/2	CLKIN x20 / 2	0x0010 0000

(1) For all boot modes that default to DSPBOOTADDR = 0x0010 0000, the bootloader code disables all C64x+ cache (L2, L1P, and L1D) so that upon exit from the bootloader code, all C64x+ memories are configured as all RAM. If cache use is required, the application code must explicitly enable the cache. For more information on the bootloader, see the *Using the TMS320DM643x Bootloader* Application Report (literature number SPRAAG0).
(2) Any *supported* PLL MODE is available. [See Table 3-8 for supported DM6433 PLL MODE options].
(3) I2C Boot (BOOTMODE[3:0] = 0101b) is *only* available if the MXI/CLKIN frequency is between 21 MHz to 30 MHz. I2C Boot is ***not*** available for MXI/CLKIN frequencies less than 21 MHz.

Table 3-8. PLL Multiplier Selection (PLLMS[2:0]) in User-Select Multiplier Fastboot Modes (FASTBOOT = 1; AEM[2:0] = 000b, 011b, 100b, or 101b)

DEVICE BOOT AND CONFIGURATION PINS	PLLC1 CLOCK SETTING AT BOOT		
PLLMS[2:0]	PLL MODE	CLKDIV1 DOMAIN (SYSCLK1 DIVIDER)	DEVICE FREQUENCY (SYSCLK1)
000	x20	/2	CLKIN x20 / 2
001	x15	/2	CLKIN x15 / 2
010	x16	/2	CLKIN x16 / 2
011	x18	/2	CLKIN x18 / 2
100	x22	/2	CLKIN x22 / 2
101	x25	/2	CLKIN x25 / 2
110	x27	/2	CLKIN x27 / 2
111	x30	/2	CLKIN x30 / 2

As shown in Table 3-5, Table 3-6, and Table 3-7, at device reset the Boot Controller defaults the DSPBOOTADDR to one of two values based on the boot mode selected. In all boot modes, the C64x+ is immediately released from reset and begins executing from address location indicated in DSPBOOTADDR.

- **Internal Bootloader ROM (0x0010 0000):** For most boot modes, the DSPBOOTADDR defaults to the internal Bootloader ROM so that the DSP can immediately execute the bootloader code in the internal ROM. The bootloader code decodes the captured BOOTMODE, FASTBOOT, PCIEN, default AEM (DAEM), and PLLMS information (in the BOOTCFG register) to determine the proper boot operation.

  Note: For all boot modes that default to DSPBOOTADDR = 0x0010 0000, the bootloader code disables all C64x+ cache (L2, L1P, and L1D) so that upon exit from the bootloader code, all C64x+ memories are configured as all RAM. If cache use is required, the application code must explicitly enable the cache. For more information on boot modes, see Section 3.4.1, *Boot Modes*. For more information on the bootloader, see the *Using the TMS320DM643x Bootloader* Application Report (literature number SPRAAG0).
- **EMIFA Chip Select Space 2 (0x4200 0000):** The EMIFA ROM Direct Boot in PLL Bypass Mode (BOOTCFG settings BOOTMODE[3:0] = 0100b, FASTBOOT = 0) is the ***only*** exception where the DSPBOOTADDR defaults to the EMIFA Chip Select Space 2. The DSP begins execution directly from the external ROM at this EMIFA space.

For more information how the bootloader code handles each boot mode, see *Using the TMS320DM643x Bootloader* Application Report (literature number SPRAAG0).

3.4.1.1 FASTBOOT

When DM6433 exits pin reset ($\overline{\text{RESET}}$ or $\overline{\text{POR}}$ released), the PLL Controllers (PLLC1 and PLLC2) default to PLL Bypass Mode. This means the PLLs are disabled, and the MXI/CLKIN clock input is driving the chip. All the clock domain divider ratios discussed in Section 6.3.4, *DM6433 Power and Clock Domains*, still apply. For example, assume an MXI/CLKIN frequency of 27 MHz—meaning the internal clock source for EMIFA is at CLKDIV3 domain = 27 MHz/3 = 9 MHz, a very slow clock. In addition, the EMIFA registers are reset to the slowest configuration which translates to very slow peripheral operation/boot.

To optimize boot time, the user should reprogram clock settings via the PLLC as early as possible during the boot process. The FASTBOOT pin facilitates this operation by allowing the device to boot at a faster clock rate.

Except for the EMIFA ROM Direct Boot in PLL Bypass Mode (BOOTCFG settings BOOTMODE[3:0] = 0100b, FASTBOOT = 0), all other boot modes default to executing from the Internal Bootloader ROM. The first action that the bootloader code takes is to decode the boot mode. If the FASTBOOT option is selected (BOOTCFG.FASTBOOT = 1), the bootloader software begins by programming the PLLC1 (System PLLC) to PLL Mode to give the device a slightly faster operation before fetching code from external devices. The exact PLL multiplier that the bootloader uses is determined by the AEM[2:0] and PLLMS[2:0] settings, as shown in Table 3-6 and Table 3-7.

Some boot modes *must* be accompanied with FASTBOOT = 1 so that the corresponding peripheral can run at a reasonable rate to communicate to the external device(s). This includes PCI boot.

Note: PLLC2 still stays in PLL Bypass Mode, the bootloader *does not* reconfigure it.

3.4.1.2 Selecting FASTBOOT PLL Multiplier

Table 3-6, Table 3-7, and Table 3-8 show the PLL multipliers used by the bootloader code during fastboot (FASTBOOT = 1) and the resulting device frequency. The user is responsible for selecting the bootmode with the appropriate PLL multiplier for their MXI/CLKIN clock source so that the device speed and PLL frequency range requirements are met. For the PLLC1 Clock Frequency Ranges, see Table 6-15, *PLLC1 Clock Frequency Ranges* in Section 6.7.1, *PLL1 and PLL2*.

The following are guidelines for PLL output frequency and device speed (frequency):

- **PLL Output Frequency**: (PLLOUT = CLKIN frequency * boot PLL Multiplier) ***must*** stay within the PLLOUT frequency range in Table 6-15, *PLLC1 Clock Frequency Ranges*.
- **Device Frequency**: (SYSCLK1) calculated from Table 3-6 and Table 3-7 ***must not*** exceed the SYSCLK1 maximum frequency in Table 6-15, *PLLC1 Clock Frequency Ranges*.

  For example, for a 600-MHz device with a CLKIN = 27 MHz, in order to stay within the PLLOUT frequency range and SYSCLK1 maximum frequency from Table 6-15, *PLLC1 Clock Frequency Ranges*, the user ***must*** select a boot mode with a PLL1 multiplier between x15 and x22.

3.4.1.3 EMIFA Boot Modes

As shown in Table 3-5, Table 3-6, and Table 3-7, there are different types of EMIFA Boot Modes. This subsection summarizes these types of EMIFA boot modes. For further detailed information, see the *Using the TMS320DM643x Bootloader* Application Report (literature number SPRAAG0).

- **EMIFA ROM Direct Boot in PLL Bypass Mode** (FASTBOOT = 0, BOOTMODE[3:0] = 0100b)
  - The C64x+ fetches the code directly from EMIFA Chip Select 2 Space [$\overline{\text{EM\_CS2}}$] (address 0x4200 0000)
  - The PLL is in Bypass Mode
  - EMIFA is configured as Asynchronous EMIF. The user is responsible for ensuring the desirable Asynchronous EMIF pins are available through configuration pins AEM[2:0] and AEAW[2:0]. AEM[2:0] ***must*** be configured to 001b [8-bit EMIFA (Async) Pinout Mode 1] or 011b [8-bit EMIFA (Async) Pinout Mode 3]. If AEM[2:0] = 001b, AEAW[2:0] must be configured to 100b.
- **EMIFA ROM Fastboot with AIS** (FASTBOOT = 1, BOOTMODE[3:0] = 0100b)
  - The C64x+ begins execution from the internal bootloader ROM at address 0x0010 0000.
  - The bootloader code programs PLLC1 to PLL Mode to speed up the boot process. The PLL multiplier value is determined by the AEM[2:0] and PLLMS[2:0] configurations as shown in Table 3-6 and Table 3-7.
  - The bootloader code reads code from the EMIFA $\overline{\text{EM\_CS2}}$ space using the application image script (AIS) format.
  - EMIFA is configured as Asynchronous EMIF. The user is responsible for ensuring the desirable Asynchronous EMIF pins are available through configuration pins AEM[2:0] and AEAW[2:0]. AEM[2:0] ***must*** be configured to 001b [8-bit EMIFA (Async) Pinout Mode 1] or 011b [8-bit EMIFA (Async) Pinout Mode 3]. If AEM[2:0] = 001b, AEAW[2:0] must be configured to 100b.
- **EMIFA ROM Fastboot without AIS**: (FASTBOOT = 1, BOOTMODE[3:0] = 1001b)
  - The C64x+ begins execution from the internal bootloader ROM at address 0x0010 0000.
  - The bootloader code programs PLLC1 to PLL Mode to speed up the boot process. The PLL multiplier value is determined by the AEM[2:0] and PLLMS[2:0] configurations as shown in Table 3-6 and Table 3-7.
  - The bootloader code then jumps to the EMIFA $\overline{\text{EM\_CS2}}$ space, at which point the C64x+ fetches the code directly from address 0x4200 0000.
  - EMIFA is configured as Asynchronous EMIF. The user is responsible for ensuring the desirable Asynchronous EMIF pins are available through configuration pins AEM[2:0] and AEAW[2:0]. AEM[2:0] ***must*** be configured to 001b [8-bit EMIFA (Async) Pinout Mode 1] or 011b [8-bit EMIFA (Async) Pinout Mode 3]. If AEM[2:0] = 001b, AEAW[2:0] must be configured to 100b.
- **NAND Flash Boot**: (FASTBOOT = 0 or 1, BOOTMODE[3:0] = 0111b)

- The C64x+ begins execution from the internal bootloader ROM at address 0x0010 0000.
- Depending on the FASTBOOT, AEM[2:0], and PLLMS[2:0] settings, the bootloader code may program the PLLC1 to PLL Mode to speed up the boot process. See Table 3-5, Table 3-6, and Table 3-7.
- The bootloader code reads the code from EMIFA (NAND) $\overline{\text{EM\_CS2}}$ (address 0x4200 0000) using AIS format.
- EMIFA is configured in NAND mode. The user is responsible for ensuring the desirable Asynchronous EMIF pins are available through configuration pins AEM[2:0] and AEAW[2:0]. AEM[2:0] ***can*** be configured to 001b [8-bit EMIFA (Async) Pinout Mode 1], 011b [8-bit EMIFA (Async) Pinout Mode 3], 100b [8-bit EMIFA (NAND) Pinout Mode 4], or 101b [8-bit EMIFA (NAND) Pinout Mode 5]. If AEM[2:0] = 001b, AEAW[2:0] must be configured to 100b.

3.4.1.4 Serial Boot Modes (I2C, UART[UART0], SPI[McBSP0])

This subsection discusses how the bootloader configures the clock dividers for the serial boot modes—I2C boot, UART boot, and SPI boot.

3.4.1.4.1 I2C Boot

If FASTBOOT = 0, then I2C Boot (BOOTMODE = 0101) is performed in Standard-Mode (up-to 100 kbps). If FASTBOOT = 1, then I2C Boot is performed in Fast-Mode (up-to 400 kbps). The actual I2C data transfer rate is dependent on the MXI/CLKIN frequency.

This is how the bootloader programs the I2C:

- I2C Boot in Fast-Mode (BOOTMODE[3:0] = 0101b, FASTBOOT = 1)
  - I2C register settings: ICPSC.IPSC = 2_{10}, ICCLKL.ICCL = 8_{10}, ICCKH.ICCH = 8_{10}
  - Resulting in the following I2C prescaled module clock frequency (internal I2C clock):
    - (CLKIN frequency in MHz) / 3
  - Resulting in the following I2C serial clock (SCL):
    - SCL frequency (in kHz) = (CLKIN frequency in MHz) / 78 * 1000
    - SCL low pulse duration (in µs) = 39 / (CLKIN frequency in MHz)
    - SCL high pulse duration (in µs) = 39 / (CLKIN frequency in MHz)
- I2C Boot in Standard-Mode (BOOTMODE[3:0] = 0101b, FASTBOOT = 0)
  - I2C register settings: ICPSC.IPSC = 2_{10}, ICCLKL.ICCL = 45_{10}, ICCKH.ICCH = 45_{10}
  - Resulting in the following I2C prescaled module clock frequency (internal I2C clock):
    - (CLKIN frequency in MHz) / 3
  - Resulting in the following I2C serial clock (SCL):
    - SCL frequency (in kHz) = (CLKIN frequency in MHz) / 300 * 1000
    - SCL low pulse duration (in µs) = 150 / (CLKIN frequency in MHz)
    - SCL high pulse duration (in µs) = 150 / (CLKIN frequency in MHz)

Note: The I2C peripheral requires that the prescaled module clock frequency ***must*** be between 7 MHz and 12 MHz. Therefore, the I2C boot is *only* available for MXI/CLKIN frequency between 21 MHz and 30 MHz.

For more details on the I2C periperhal configurations and clock requirements, see the *TMS320DM643x DMP Inter-Integrated Circuit (I2C) Peripheral* User's Guide (literature number SPRU991).

3.4.1.4.2 UART Boot

For UART Boot (BOOTMODE[3:0] = 1000b or 1110b), the bootloader programs the UART0 peripheral as follows:

- UART0 divisor is set to 15_{10}
- Resulting in this UART0 baud rate in kilobit per second (kbps):
  - (CLKIN frequency in MHz) * 1000 / (15 * 16)

The user is responsible for ensuring the resulting baud rate is appropriate for the system. The UART0 divisor (/15) is optimized for CLKIN frequency between 27 to 29 MHz to stay within 5% of the 115200-bps baud rate.

For more details on the UART peripheral configurations and clock generation, see the *TMS320DM643x DMP Universal Asynchronous Receiver/Transmitter (UART)* User's Guide (literature number SPRU997).

3.4.1.4.3 SPI Boot

Both 16-bit address SPI Boot (BOOTMODE = 0110) and 24-bit address SPI boot are performed through the McBSP0 peripheral. The bootloader programs the McBSP0 peripheral as follows:

- McBSP0 register settings: SRGR.CLKGDV = 2_{10}
- Resulting in this SPI serial clock frequency:
  - (SYSCLK3 frequency in MHz) / 3

SYSCLK3 frequency = SYSCLK1 frequency / 6. SYSCLK1 frequency during boot can be found in Table 3-5, Table 3-6, Table 3-7, and/or Table 3-8 based on the boot mode selection.

For example, if BOOTMODE[3:0] = 0110b, FASTBOOT = 1, the MXI/CLKIN frequency = 27 MHz, AEM[2:0] = 000b, PLLMS[2:0] = 100b, the combination of Table 3-7 and Table 3-8 indicates that the device frequency (SYSCLK1) is CLKIN x 22 / 2 = 297 MHz. This means SYSCLK3 frequency is 297 / 6 = 49.5 MHz, resulting in SPI serial clock frequency of 49.5 / 3 = 16.5 MHz.

3.4.1.5 Host Boot Modes

The DM6433 supports two types of host boots—PCI Boot *or* HPI Boot.

The PCI Boot (BOOTMODE[3:0] = 0001b or 0010b, PCIEN = 1) is *only* available in fastboot (FASTBOOT = 1), as shown in Table 3-6 and Table 3-7.

The HPI Boot is available in fastboot and non-fastboot, as shown in Table 3-5, Table 3-6, and Table 3-7.

Note: The HPI $\overline{\text{HSTROBE}}$ inactive pulse duration timing requirement [$t_{w(HSTBH)}$] is dependent on the HPI internal clock source (SYSCLK3) frequency (see Section 6.13.3, *HPI Electrical Data/Timing*). The external host ***must*** be aware of the SYSCLK3 frequency during boot to ensure the $\overline{\text{HSTROBE}}$ pulse duration timing requirement is met.

3.4.2 Bootmode Registers

3.4.2.1 BOOTCFG Register

The Device Bootmode (see Section 3.4.1, *Boot Modes*) and Configuration pins (see Section 3.5.1, *Device and Peripheral Configurations at Device Reset*) latched at reset are captured in the Device Boot Configuration (BOOTCFG) register which is accessible through the System Module. This is a *read-only* register. The bits show the values latched from the corresponding configuration pins sampled at device reset. For more information on how these pins are sampled at device reset, see Section 6.5.1.2, *Latching Boot and Configuration Pins*. For the corresponding device boot and configuration pins, see Table 2-5, *BOOT Terminal Functions*.

31	20	19	18	17	16

LEGEND: R = Read only; L = pin state latched at reset rising edge; -*n* = value after reset

Figure 3-3. BOOTCFG Register—0x01C4 0014

Table 3-9. BOOTCFG Register Description

Bit	Field Name	Description
31:20	RESERVED	Reserved. Writes have no effect.
19	FASTBOOT	Fastboot (see Section 3.4.1.1, FASTBOOT) This field is used by the device bootloader code to determine if it needs to speed up the device to PLL mode before booting. 0 = No Fastboot 1 = Fastboot **The default value is latched from FASTBOOT configuration pin.**
18	RSV	Reserved. Writes have no effect.
17	DPCIEN	PINMUX1.PCIEN Default (see Section 3.5.1.3, *PCI Enable*) For more details on the PCIEN settings, see Section 3.7.2.2, *PINMUX1 Register Description*. This field affects the pin mux control by setting the default of PINMUX1.PCIEN. This field determines if the internal pullup/pulldown resistors on the PCI capable pins are enabled/disabled. This field *does not* affect PCI register setting. The user ***must*** keep the value on the PCIEN pin constant throughout the operation. **The default value is from the PCIEN configuration pin.**
16:15	RSV	Reserved. Writes have no effect.
14:12	PLLMS	PINMUX0.AEAW default [AEAW] and Fastboot PLL Multiplier Select [PLLMS] (see Section 3.5.1.2, *EMIFA Address Width Select [AEAW] and Fast Boot PLL Multiplier Select [PLLMS]*) The AEAW[2:0]/PLLMS configuration pins serve two purposes: **AEAW[2:0]: 8-bit EMIFA (Async) Pinout Mode 1 Address Width** If AEM = 001, this field serves as AEAW and it indicates the 8-bit EMIFA (Async) Pinout Mode 1 Address Width. In this case, this field affects pin mux control only by setting the default of Pin Mux Control Register PINMUX0.AEAW[2:0]. This field does not affect EMIFA register settings. For more details on the AEAW settings, see Section 3.7.2.1, *PINMUX0 Register Description*. **PLLMS: Fastboot PLL Multiplier Select** If FASTBOOT = 1 and AEM[2:0] = 000b, 011b, 100b, *or* 101b, this field selects the FASTBOOT PLL Multiplier. In this case, this field *does not* affect the pin mux control or the EMIFA register settings. The bootloader code uses this field to determine the PLL multiplier used for Fastboot.
11	RSV	Reserved. Writes have no effect.
10:8	DAEM	PINMUX0.AEM default [DAEM] (see Section 3.5.1.1, *EMIFA Pinout Mode (AEM[2:0])*) For more details on the AEM settings, see Section 3.7.2.1, *PINMUX0 Register Description*. This field affects pin mux control by setting the default of PINMUX0.AEM. This field *does not* affect EMIFA Register settings. **The default value is latched from the AEM[2:0] configuration pins.**
7:4	RESERVED	Reserved. Writes have no effect.
3:0	BOOTMODE	Boot Mode (see Section 3.4.1, *Boot Modes*) This field is used in conjunction with FASTBOOT, PCIEN, AEM, and PLLMS to determine the device boot mode. **The default value is latched from the BOOTMODE[3:0] configuration pins.**

3.4.2.2 BOOTCMPLT Register

If the bootloader code detects an error during boot, it records the error status in the Boot Complete (BOOTCMPLT) register.

In addition, the BOOTCMPLT register is used for communication between the external host and the bootloader code during a Host Boot (HPI Boot or PCI Boot). Once the external host has completed boot, it ***must*** perform the following communication with the bootloader code:

- Write the desired 32-bit CPU starting address in the DSPBOOTADDR register (see Section 3.4.2.3, *DSPBOOTADDR Register*).
- Write a '1' to the Boot Complete (BC) bit field in the BOOTCMPLT register to indicate that the host has completed booting this device.

Once the bootloader code detects BC = 1, it directs the CPU to begin executing from the DSPBOOTADDR register.

The BOOTCMPLT register is reset by any device-level global reset. For the list of device-level global resets, see Section 6.5, *Reset*.

31	20	19	16
RESERVED		ERR

Figure 3-4. BOOTCMPLT Register— 0x01C4 000C

Table 3-10. BOOTCMPLT Register Description

Bit	Field Name	Description
31:20	RESERVED	Reserved. For proper device operation, the user should *only* write "0" to these bits.
19:16	ERR	Boot Error 0000 = No Error **(default)**. 0001 - 1111 = bootloader software detected a boot error and aborted the boot. For the error codes, see the *Using the TMS320DM643x DMP Bootloader* Application Report (literature number SPRAAG0).
15:1	RESERVED	Reserved. For proper device operation, the user should *only* write "0" to these bits.
0	BC	Boot Complete Flag from Host This field is *only* applicable to Host Boots. 0 = Host *has not* completed booting this device **(default)**. 1 = Host *has* completed booting this device. DSP can begin executing from the DSPBOOTADDR register value.

3.4.2.3 DSPBOOTADDR Register

The DSP Boot Address (DSPBOOTADDR) register contains the starting address for the C64x+ CPU. Whenever the C64x+ is released from reset, it begins executing from the location pointed to by DSPBOOTADDR register. For Host boots (HPI Boot or PCI Boot), the DSPBOOTADDR register is also used for communication between the Host and the bootloader code during boot.

The DSPBOOTADDR register is reset by any device-level global reset. For the list of device-level global resets, see Section 6.5, *Reset*.

DSPBOOTADDR	
R/W-0x0010 0000 *or* 0x4200 00000	

LEGEND: R = Read; W = Write; -*n* = value after reset

Figure 3-5. DSPBOOTADDR Register— 0x01C4 0008

Table 3-11. DSPBOOTADDR Register Description

Bit	Field Name	Description
31:0	DSPBOOTADDR	DSP Boot Address After boot, the C64x+ CPU begins execution from this 32-bit address location. The lower 10 bits (bits 9:0) should *always* be programmed to "0" as they are ignored by the C64x+. The default value of the DSPBOOTADDR depends on the boot mode selected. The DSPBOOTADDR defaults to 0x0010 0000 when the Internal Bootloader ROM is used. *or* The DSPBOOTADDR defaults to 0x4200 0000 when EMIFA $\overline{CS2}$ Space is used. For the boot mode selections, see Table 3-5, *Non-Fastboot Modes*; Table 3-6, *Fixed-Multiplier Fastboot Modes*; and Table 3-7, *User-Select Multiplier Fastboot Modes*.

For Non-Host Boot Modes, software can leave the DSPBOOTADDR register at default.

For Host Boots (HPI Boot or PCI Boot), the DSPBOOTADDR register is also used for communication between the Host and the bootloader code during boot. For Host Boots, the DSPBOOTADDR register defaults to Internal Bootloader ROM, and the C64x+ CPU is immediately released from reset so that it can begin executing the bootloader code in this internal ROM. The bootloader code waits for the Host to boot the device. Once the Host is done booting the device, it ***must*** write a new starting address into the DSPBOOTADDR register, and follow with writing BOOTCMPLT.BC = 1 to indicate the boot is complete. As soon as the bootloader code detects BOOTCMPLT.BC = 1, it instructs the CPU to jump to this new DSPBOOTADDR address. At this point, the CPU continues the rest of the code execution starting from the new DSPBOOTADDR location and the boot is completed.

3.5 Configurations At Reset

Some device configurations are determined at reset. The following subsections give more details.

3.5.1 Device and Peripheral Configurations at Device Reset

Table 2-5, BOOT Terminal Functions, lists the device boot and configuration pins that are latched at device reset for configuring basic device settings for proper device operation. Table 3-12, summarizes the device boot and configuration pins, and the device functions that they affect.

Table 3-12. Default Functions Affected by Device Boot and Configuration Pins

DEVICE BOOT AND CONFIGURATION PINS	BOOT SELECTED	PIN MUX CONTROL	GLOBAL SETTING	PERIPHERAL SETTING
BOOTMODE[3:0]	Boot Mode	**PINMUX0/PINMUX1 Registers**: Based on BOOTMODE[3:0], the bootloader code programs PINMUX0 and PINMUX1 registers to select the appropriate pin functions required for boot.	**I/O Pin Power**: Based on BOOTMODE[3:0], the bootloader code programs VDD3P3V_PWDN register to power up the I/O pins required for boot.	**PSC/Peripherals**: Based on BOOTMODE[3:0], the bootloader code programs the PSC to put boot-related peripheral(s) in the Enable State, and programs the peripheral(s) for boot operation.
FASTBOOT	Fastboot	–	**Sets Device Frequency**: Based on BOOTMODE, FASTBOOT, PLLMS, and AEM the bootloader code programs PLLC1.	–
AEAW[2:0]/PLLMS[2:0]	If FASTBOOT = 1 and AEM = 000b, 011b, 100b or 101b the PLLMS[2:0] selects the FASTBOOT PLL Multiplier.	**PINMUX0.AEAW**: If PINMUX0.AEM = 001b, AEAW[2:0] must be set to 100b to configure maximum address bus width for EMIFA. Affects the pin muxing in EMIFA/VPSS Sub-Block 0.	**Sets Device Frequency**: Based on BOOTMODE, FASTBOOT, PLLMS, and AEM the bootloader code programs PLLC1.	–
AEM[2:0]	Together with FASTBOOT and PLLMS[2:0] , determines the FASTBOOT PLL Multiplier.	**PINMUX0.AEM**: Sets the default of this field to control the EMIFA Pinout Mode. Affects the pin muxing in EMIFA/VPSS Sub-Block 0, 1, and 3.	**Sets Device Frequency**: Based on BOOTMODE, FASTBOOT, PLLMS, and AEM the bootloader code programs PLLC1.	**PSC/EMIFA**: The EMIFA module state defaults to SwRstDisable if AEM = 0; otherwise, the EMIFA module state defaults to Enable.
PCIEN (1)	**Host Boot**: PCIEN selects the type of Host Boot (HPI Boot *or* PCI Boot)	**PINMUX1.PCIEN**: sets this field to control the PCI pin muxing in Host Block, PCI Data Block, GPIO Block, EMIFA/VPSS Sub-Block 0 and Sub-Block 3. (1)(2)	–	**PSC/Peripheral** *(Applicable to Host Boot only)*: Based on the Host Boot type (PCI *or* HPI), the bootloader code programs the PSC to put the corresponding peripheral in the Enable State, and programs the peripheral for boot operation.

(1) Software can modify all PINMUX0 and PINMUX1 bit fields from their defaults, ***except*** for PINMUX1.PCIEN.
(2) In addition to pin mux control, PCIEN also affects the internal pullup/down resistors of the PCI capable pins. When PCIEN = 0, internal pullup/down resistors on the PCI capable pins are enabled. When PCIEN = 1, internal pullup/down resistors on the PCI capable pins are disabled to be compliant to the *PCI Local Bus Specification Revision 2.3*.

For proper device operation, external pullup/pulldown resistors may be required on these device boot and configuration pins. For discussion situations where external pullup/pulldown resistors are required, see Section 3.9.1, *Pullup/Pulldown Resistors*.

Note: Except for PCIEN, all other DM6433 configuration inputs (BOOTMODE[3:0], FASTBOOT, AEAW[2:0]/PLLMS[2:0] and AEM[2:0]) are multiplexed with other functional pins. These pins function as device boot and configuration pins only during device reset. The user ***must*** take care of any potential data contention in the system. To help avoid system data contention, the DM6433 puts these configuration pins into a high-impedance state (Hi-Z) when device reset ($\overline{\text{RESET}}$ *or* $\overline{\text{POR}}$) is asserted, and continues to hold them in a high-impedance state until the internal global reset is removed; at which point, the default peripheral (either GPIO *or* EMIFA based on default of AEM[2:0]) will now control these pins.

All of the device boot and configuration pin settings are captured in the corresponding bit fields in the BOOTCFG register (see Section 3.4.2.1).

The following subsections provide more details on the device configurations determined at device reset: AEM, AEAW/PLLMS, and PCIEN.

3.5.1.1 EMIFA Pinout Mode (AEM[2:0])

To support different usage scenarios, the DM6433 provides intricate pin multiplexing between the EMIFA and other peripherals. The PINMUX0.AEM register bit field in the System Module determines the EMIFA Pinout Mode. The AEM[2:0] pins only select the default EMIFA Pinout Mode. It is latched at device reset de-assertion (high) into the BOOTCFG.DAEM bit field. The AEM[2:0] value also sets the default of the PINMUX0.AEM bit field. While the BOOTCFG.DAEM bit field shows the actual latched value and *cannot* be modified, the PINMUX0.AEM value can be changed by software to modify the EMIFA Pinout Mode.

Note: The AEM[2:0] value *does not* affect the operation of the EMIFA module itself. It *only* affects which EMIFA pins are brought out to the device pins. For more details on the AEM settings, see Section 3.7, *Multiplexed Pin Configurations*.

In addition, for Fastboot modes (FASTBOOT = 1), the bootloader code determines the PLL1 multiplier based on the default settings of AEM[2:0] and PLLMS[2:0]. For more details, see Section 3.4.1.1, *Fastboot*, and Section 3.5.1.2, *EMIFA Address Width Select (AEAW) and FASTBOOT PLL Multiplier Select (PLLMS)*.

3.5.1.2 EMIFA Address Width Select (AEAW) and FASTBOOT PLL Multiplier Select (PLLMS)

The AEAW[2:0]/PLLMS[2:0] pins serve two functional purposes (AEAW *or* PLLMS), depending on the FASTBOOT and AEM settings. The AEAW[2:0]/PLLMS[2:0] pins are latched at device reset de-assertion (high) and captured in the BOOTCFG.PLLMS bit field. This value also sets the default of the PINMUX0.AEAW field.

While the BOOTCFG.PLLMS field shows the actual latched value and *cannot* be modified, the PINMUX0.AEAW value *can* be changed by software to modify the EMIFA pinout.

AEAW as EMIFA Address Width Select (AEAW)

If AEM[2:0] = 001b [8-bit EMIFA (Async) Pinout Mode 1], the AEAW[2:0]/PLLMS[2:0] pins serve as AEAW to set the default of the EMIFA Address Width Selection.

On DM6433, only AEAW = 100b is supported. If AEM[2:0] = 001b [8-bit EMIFA (Async) Pinout Mode 1], AEAW ***must*** be set to 100b to select full addres width for EMIFA. For other EMIFA Pinout Modes (AEM not 001b), AEAW is *not* applicable in determining the EMIFA address width.

Note: AEAW[2:0] value ***does not*** affect the operation of the EMIFA module itself.

AEAW as Fast Boot PLL Multiplier Select (PLLMS)

If FASTBOOT = 1 and AEM[2:0] = 000b [No EMIFA], 011b [8-bit EMIFA (Async) Pinout Mode 3], 100b [8-bit EMIFA (NAND) Pinout Mode 4], *or* 101b [8-bit EMIFA (NAND) Pinout Mode 5], the AEAW[2:0]/PLLMS[2:0] pins serve as PLLMS to select PLL multiplier for Fastboot modes.

For more information on boot modes and the FASTBOOT PLL multiplier selection, see Section 3.4.1, *Boot Modes*.

3.5.1.3 PCI Enable (PCIEN)

The PCIEN configuration pin determines if the PCI peripheral is used on this device. If PCIEN = 1 indicating the PCI *is* used, then the PCI multiplexed pins default to PCI functions, and the pins' corresponding internal pullup/pulldown resistors are disabled. If PCIEN = 0 indicating the PCI *is not* used, then the PCI muxed pins default to non-PCI functions, and the pins' corresponding internal pullup/pulldown resistors are enabled.

The PCIEN setting is captured and stored in the BOOTCFG.DPCIEN bit field, and also in the PINMUX1.PCIEN bit field. These values *cannot* be changed by software. Furthermore, for proper device operation, the user ***must*** hold the desired setting at the PCIEN pin throughout device operation.

3.6 Configurations After Reset

The following sections provide details on configuring the device after reset.

Multiplexed pins are configured both at and after reset. Section 3.5.1, *Device and Peripheral Configurations at Device Reset*, discusses multiplexed pin control at reset. For more details on multiplexed pins control after reset, see Section 3.7 , *Multiplexed Pin Configurations*.

3.6.1 Switch Central Resource (SCR) Bus Priorities

Prioritization within the Switched Central Resource (SCR) is programmable for each master. The register bit fields and default priority levels for DM6433 bus masters are shown in Table 3-13, *DM6433 Default Bus Master Priorities*. The priority levels should be tuned to obtain the best system performance for a particular application. Lower values indicate higher priority. For most masters, their priority values are programmed at the system level by configuring the MSTPRI0 and MSTPRI1 registers. Details on the MSTPRI0/1 registers are shown in Figure 3-6 and Figure 3-7. The C64x+, VPSS, and EDMA masters contain registers that control their own priority values.

Table 3-13. DM6433 Default Bus Master Priorities

Priority Bit Field	Bus Master	Default Priority Level
VPSSP	VPSS	0 (VPSS PCR Register)
EDMATC0P	EDMATC0	0 (EDMACC QUEPRI Register)
EDMATC1P	EDMATC1	0 (EDMACC QUEPRI Register)
EDMATC2P	EDMATC2	0 (EDMACC QUEPRI Register)
C64X+_DMAP	C64X+ (DMA)	7 (C64x + MDMAARBE.PRI field)

3.6.2 Peripheral Selection After Device Reset

After device reset, most peripheral configurations are done within the peripheral's registers. This section discusses some additional peripheral controls in the System Module. For information on multiplexed pin controls that determine what peripheral pins are brought out to the pins, see Section 3.7, *Multiplexed Pin Configurations*.

3.6.2.1 HPI Control Register (HPICTL)

The HPI Control (HPICTL) register determines the Host Burst Write Time-Out value. **The user should *only* modify this register once during device initialization. When modifying this register, the user *must* ensure the HPI FIFOs are empty and there are no on-going HPI transactions.**

Table 3-16. HPICTL Register Description

Bit	Field Name	Description
31:10	RESERVED	Reserved. Read-only, writes have no effect.
9:8	RESERVED	Reserved. For proper device operation, the user should *only* write "0" to these bits (default).
7:0	TIMOUT	Host Burst Write Timeout Value When the HPI time-out counter reaches the value programmed here, the HPI write FIFO content is flushed. For more details on the time-out counter and its use in write bursting, see the *TMS320DM643x DMP Host Port Interface (HPI)* User's Guide (literature number SPRU998).

3.6.2.2 Timer Control Register (TIMERCTL)

The Timer Control Register (TIMERCTL) provides additional control for Timer0 and Timer2. **The user should only modify this register once during device initialization, when the corresponding Timer is not in use.**

- Timer 2 Control: The TIMERCTL.WDRST bit determines if the WatchDog timer event (Timer 2) can cause a device max reset. For more details on the description of a maximum reset, see Section 6.5.3, *Maximum Reset*.
- Timer 0 Control: The TINP0SEL bit selects the clock source connected to Timer0's TIN0 input.

Bit	Field Name	Description
31:2	RESERVED	Reserved. Read-Only, writes have no effect.
1	TINP0SEL	Timer0 External Input (TIN0) Select 0 = Timer0 external input comes directly from the TINP0L pin (**default**). 1 = Timer0 external input is TINP0L pin divided by 6. For example, if TINP0L = 27MHz, Timer0 input TIN0 is 27MHz / 6 = 4.5 MHz.
0	WDRST	WatchDog Reset Enable 0 = WatchDog Timer Event (WDINT from Timer2) does not cause device reset. 1 = WatchDog Timer Event (WDINT from Timer2) causes a device max reset (**default**).

3.6.2.3 EDMA TC Configuration Register (EDMATCCFG)

The EDMA Transfer Controller Configuration (EDMATCCFG) register configures the default burst size (DBS) for EDMA TC0, EDMA TC1, and EDMA TC2. For more information on the correct usage of DBS, see the *TMS320DM643x DMP Enhanced Direct Memory Access (EDMA) Controller* User's Guide (literature number SPRU987). **The user should only modify this register once during device initialization and when the corresponding EDMA TC is not in use**.

3:2	TC1DBS	EDMA TC1 Default Burst Size 00 = 16 byte 01 = 32 byte (**default**) 10 = 64 byte 11 = reserved EDMA TC1 is intended for high throughput bulk transfers. TC1 FIFO size is 256 bytes, regardless of Default Burst Size setting.
1:0	TC0DBS	EDMA TC0 Default Burst Size 00 = 16 byte (**default**) 01 = 32 byte 10 = 64 byte 11 = reserved EDMA TC0 is intended for short burst transfers with stringent deadlines (e.g., McBSP, McASP). TC0 FIFO size is 128 bytes, regardless of Default Burst Size setting.

3.7 Multiplexed Pin Configurations

DM6433 makes extensive use of pin multiplexing to accommodate a large number of peripheral functions in the smallest possible package, providing ultimate flexibility for end applications.

The Pin Multiplex Registers PINMUX0 and PINMUX1 in the System Module are responsible for controlling all pin multiplexing functions on the DM6433. The default setting of some of the PINMUX0 and PINMUX1 bit fields are configured by configuration pins latched at reset (see Section 3.5.1, *Device and Peripheral Configurations at Device Reset*). After reset, software may program the PINMUX0 and PINMUX1 registers to switch pin functionalities.

The following peripherals have multiplexed pins: VPSS (VPBE), EMIFA, PCI, HPI, VLYNQ, EMAC, McASP0, McBSP0, PWM0, PWM1, PWM2, Timer0, Timer1, UART0, and GPIO.

The device is divided into the following Pin Multiplexed Blocks (Pin Mux Blocks):

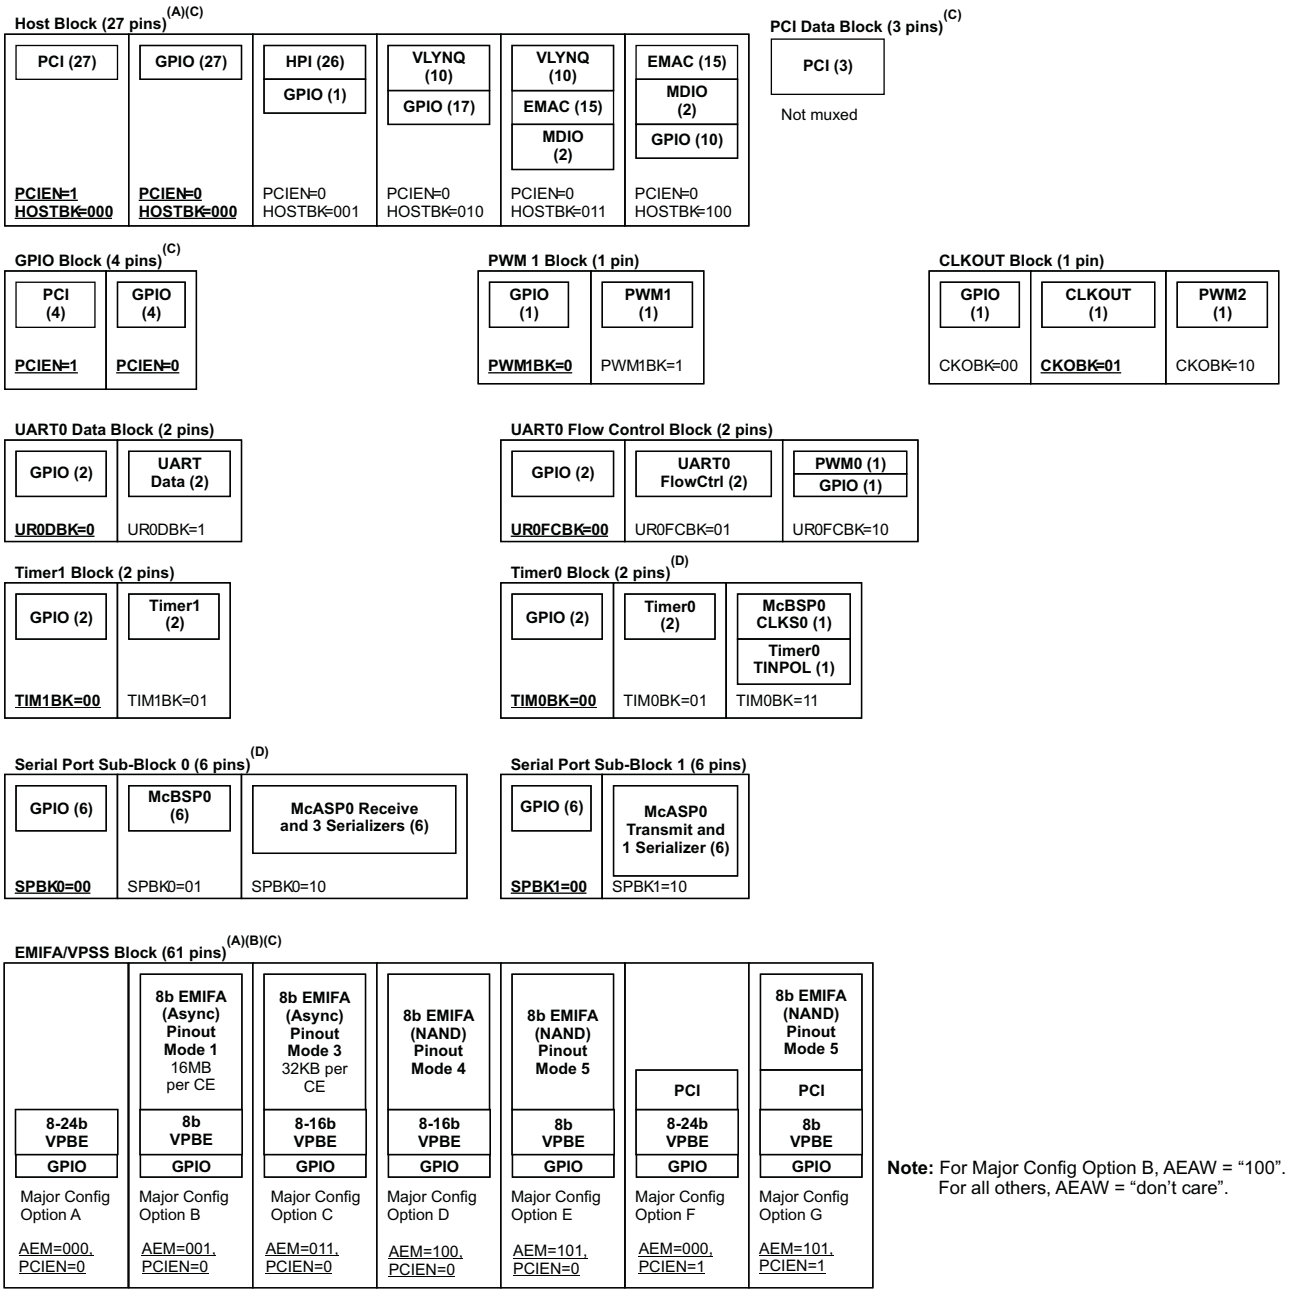
- **EMIFA/VPSS Block:** VPSS (VPBE), EMIFA, part of PCI, GPIO. This block is further subdivided into these sub-blocks:
  - **Sub-Block 0:** part of EMIFA (data, address, control), part of PCI, and GPIO
  - **Sub-Block 1:** VPBE (VENC), part of EMIFA (data, address, control), and GPIO
  - **Sub-Block 2:** part of EMIFA (control signals EM_WAIT/(RDY/$\overline{\text{BSY}}$), $\overline{\text{EM\_OE}}$, and $\overline{\text{EM\_WE}}$)
  - **Sub-Block 3:** part of EMIFA (address EM_A[12:5]), part of PCI, and GPIO
- **Host Block:** HPI, VLYNQ, EMAC, part of PCI, and GPIO
- **PCI Data Block:** part of PCI
- **GPIO Block:** part of PCI and GPIO
- **Serial Port Block:** McBSP0, McASP0, and GPIO. This block is further sub-divided into sub-blocks.
  - **Serial Port Sub-Block 0:** McBSP0, part of McASP0, and GPIO
  - **Serial Port Sub-Block 1:** part of McASP0, and GPIO
- **UART0 Flow Control Block:** UART0 flow control, PWM0, and GPIO
- **UART0 Data Block:** UART0 data and GPIO
- **Timer0 Block:** Timer0 and McBSP0 CLKS pins
- **Timer1 Block:** Timer1
- **PWM1 Block:** PWM1 and GPIO
- **CLKOUT Block:** CLKOUT0, PWM2, and GPIO

As shown in the list above, the PCI, McBSP0, and UART0 peripherals span multiple Pin Mux Blocks. To use these peripherals, they must be selected in all relevant Pin Mux Blocks. For more details, see Section 3.7.3, *Pin Multiplexing Details*, and Section 3.7.3.2, *Peripherals Spanning Multiple Pin Mux Blocks*.

Note: There is no actual pin multiplexing in EMIFA/VPSS Sub-Block 2 and the PCI Data Block. However these are still considered "pin mux blocks" because they contain part of the pins necessary for EMIFA and PCI, respectively.

A high level view of the Pin Mux Blocks is shown in Figure 3-11. In each Pin Mux Block, the PINMUX0/PINMUX1 default settings are underlined.

Note: Some default pin functions are determined by configuration pins (PCIEN, AEAW[2:0], AEM[2:0]); therefore, more than one configuration setting can serve as default based on the configuration pin settings latched at device reset.



A. Default settings for PINMUX0 and PINMUX1 registers are underlined.

B. EMIFA/VPSS Block: shows the Major Config Options based on the AEM and PCIEN settings. Actual pin functions in the EMIFA/VPSS Block are further determined by other PINMUX fields.

C. PCI pins span multiple blocks (Host Block, GPIO Block, EMIFA/VPSS Block, and PCI Data Block). For PCI to be operational, PCI pins must be selected in all of these Pin Mux Blocks. For the EMIFA/VPSS Block, PCI is only supported if AEM = 000b or 101b.

D. McBSP0 pins span multiple blocks (Serial Port Sub-Block0 and Timer0 Block). Serial Port Sub-Block0 contains most of the pins needed for McBSP0 operation. Timer0 Block contains the optional external clock source input CLKS0.

Figure 3-11. Pin Mux Block Selection

3.7.1 Pin Muxing Selection At Reset

This section summarizes pin mux selection at reset.

The configuration pins AEM[2:0], AEAW[2:0], and PCIEN latched at device reset determine default pin muxing for the following Pin Mux Blocks:

- EMIFA/VPSS Block: default pin mux determined by AEM[2:0], AEAW[2:0], and PCIEN. **After reset, software may modify settings in the PINMUX0 register to add VPBE functionalities into this block. However, after reset, software is not allowed to modify PINMUX1.PCIEN setting to change PCI pinout.**
  - AEM[2:0] = 000b, AEAW[2:0] = don't care, PCIEN = 0: Major Config Option A is selected. This block defaults to 61 GPIO pins.
  - AEM[2:0] = 001b, AEAW[2:0] = 100b, PCIEN = 0: Major Config Option B is selected. This block defaults to 8-bit EMIFA (Async) Pinout Mode 1, plus 24 GPIO pins.
  - AEM[2:0] = 011b, AEAW[2:0] = don't care, PCIEN = 0: Major Config Option C is selected. This block defaults to 8-bit EMIFA (Async) Pinout Mode 3, plus 33 GPIO pins.
  - AEM[2:0] = 100b, AEAW[2:0] = don't care, PCIEN = 0: Major Config Option D is selected. This block defaults to 8-bit EMIFA (NAND) Pinout Mode 4, plus 47 GPIO pins.
  - AEM[2:0] = 101b, AEAW[2:0] = don't care, PCIEN = 0: Major Config Option E is selected. This block defaults to 8-bit EMIFA (NAND) Pinout mode 5, plus 47 GPIO pins.
  - AEM[2:0] = 000b, AEAW[2:0] = don't care, PCIEN = 1: Major Config Option F is selected. This block defaults to PCI pins, plus 45 GPIO pins.
  - AEM[2:0] = 101b, AEAW[2:0] = don't care, PCIEN = 1: Major Config Option G is selected. This block defaults to 8-bit EMIFA (NAND) Pinout mode 5, PCI pins, plus 31 GPIO pins.
- Host Block: default pin mux determined by PCIEN.
  - PCIEN = 0: the 27 pins in Host Block default to GPIO function. Software may program PINMUX1.HOSTBK to modify pin functions after reset.
  - PCIEN = 1: the 27 pins in Host Block serve as PCI pins. **Software is not allowed to modify this setting after reset.**
- GPIO Block: pin function determined by PCIEN configuration pin.
  - PCIEN = 0: the 4 pins in GPIO Block serve as GPIO pins. **Software is not allowed to modify this setting after reset.**
  - PCIEN = 1: the 4 pins in GPIO Block serve as PCI pins. **Software is not allowed to modify this setting after reset.**
- PCI Data Block: pin function determined by PCIEN.
  - PCIEN = 0: the 3 pins in PCI Data Block have no function and should be left unconnected. **Software is not allowed to modify this setting after reset.**
  - PCIEN = 1: the 3 pins in PCI Data Block serve as PCI pins. **Software is not allowed to modify this setting after reset.**

For a description of the PINMUX0 and PINMUX1 registers and more details on pin muxing, see Section 3.7.2.

3.7.2 Pin Muxing Selection After Reset

The PINMUX0 and PINMUX1 registers in the System Module allow software to select the pin functions in the Pin Mux Blocks. The pin control of some of the Pin Mux Blocks requires a combination of PINMUX0/PINMUX1 bit fields. For more details on the combination of the PINMUX bit fields that control each muxed pin, see Section 3.7.3.1, *Multiplexed Pins on DM6433*.

This section only provides an overview of the PINMUX0 and PINMUX1 registers. For more detailed discussion on how to program each Pin Mux Block, see Section 3.7.3, *Pin Multiplexing Details*.

3.7.2.1 PINMUX0 Register Description

The Pin Multiplexing 0 Register (PINMUX0) controls the pin function in the EMIFA/VPSS Block. The PINMUX0 register format is shown in Figure 3-12 and the bit field descriptions are given in Table 3-19. Some muxed pins are controlled by more than one PINMUX bit field. For the combination of the PINMUX bit fields that control each muxed pin, see Section 3.7.3.1, *Multiplexed Pins on DM6433*. For more information on EMIFA/VPSS Block pin muxing, see Section 3.7.3.13, *EMIFA/VPSS Block Muxing*. For the pin-by-pin muxing control of the EMIFA/VPSS Block, see Section 3.7.3.13.7, *EMIFA/VPSS Block Pin-By-Pin Multiplexing Summary*.

Note: In addition to PINMUX0 bit fields, the EMIFA/VPSS Block also requires the PCIEN bit in the Pin Multiplexing 1 Register (PINMUX1, Section 3.7.2.2) to determine the PCI settings.

3.7.2.2 PINMUX1 Register Description

The Pin Multiplexing 1 Register (PINMUX1) controls the pin multiplexing of all Pin Mux Blocks. The PINMUX1 register format is shown in Figure 3-13 and the bit field descriptions are given in Table 3-20. Some muxed pins are controlled by more than one PINMUX bit field. For the combination of PINMUX bit fields that control each muxed pin, see Section 3.7.3.1, *Multiplexed Pins on DM6433*.

PCIEN = 0 and HOSTBK = 100: MII + MDIO +10 GPIO Mode. Pins function as MII (TXCLK, CRS, COL, TXD[3:0], RXVD, TXEN, RXER, RXCLK, RXD[3:0]), MDIO (MDIO, MDC), and GP[66:57]. PCIEN = 1 and HOSTBK = 000: PCI Mode (**default if PCIEN = 1**). Pins function as PCI pins: PCICLK, $\overline{\text{PCBE2}}$, $\overline{\text{PCBE1}}$, $\overline{\text{PCBE0}}$, $\overline{\text{PFRAME}}$, $\overline{\text{PIDRDY}}$, $\overline{\text{PTRDY}}$, $\overline{\text{PDEVSEL}}$, $\overline{\text{PPER}}$, $\overline{\text{PSTOP}}$, $\overline{\text{PSERR}}$, PPAR, AD[18:5], and AD03. All other PCIEN and HOSTBK combinations reserved.	**Host Block:** VLYNQ_CLOCK/PCICLK/GP[57] HD0/VLYNQ_SCRUN/AD18/GP[58] HD1/VLYNQ_RXD0/AD16/GP[59] HD2/VLYNQ_RXD1/AD17/GP[60] HD3/VLYNQ_RXD2/$\overline{\text{PCBE2}}$/GP[61] HD4/VLYNQ_RXD3/$\overline{\text{PFRAME}}$/GP[62] HD5/VLYNQ_TXD0/$\overline{\text{PIRDY}}$/GP[63] HD6/VLYNQ_TXD1/$\overline{\text{PTRDY}}$/GP[64] HD7/VLYNQ_TXD2/$\overline{\text{PDEVSEL}}$/GP[65] HD8/VLYNQ_TXD3/$\overline{\text{PPERR}}$/GP[66] HD9/MCOL/$\overline{\text{PSTOP}}$/GP[67] HD10/MCRS/$\overline{\text{PSERR}}$/GP[68] HD11/MTXD3/$\overline{\text{PCBE1}}$/GP[69] HD12/MTXD2/PPAR/GP[70] HD13/MTXD1/AD14/GP[71] HD14/MTXD0/AD15/GP[72] HD15/MTXCLK/AD12/GP[73] HHWIL/MRXDV/AD13/GP[74] HCNTL1/MTXEN/AD11/GP[75] HCNTL0/MRXER/AD10/GP[76] HR/$\overline{\text{W}}$/MRXCLK/AD8/GP[77] $\overline{\text{HDS2}}$/MRXD0/AD9/GP[78] $\overline{\text{HDS1}}$/MRXD1/AD7/GP[79] $\overline{\text{HRDY}}$/MRXD2/$\overline{\text{PCBE0}}$/GP[80] $\overline{\text{HCS}}$/MDCLK/AD5/GP[81] $\overline{\text{HINT}}$/MRXD3/AD6/GP[82] $\overline{\text{HAS}}$/MDIO/AD3/GP[83] The combination of PINMUX1 fields PCIEN and HOSTBK select the function of these 27 pins.
3:1	RESERVED	Reserved. For proper device operation, the user should only write "0" to this bit (**default**).	–

Table 3-20. PINMUX1 Register Bit Descriptions (continued)

Bit	Field Name	Description	Pins Controlled
0	PCIEN	PCI Enable. **The PINMUX1.PCIEN reflects the state of the PCIEN pin. PINMUX1.PCIEN is read only and cannot be modified by software. For proper device operation, the user must hold the desired setting at the PCIEN pin throughout device operation.** PCIEN = 0: No PCI supported. Internal pullup/pulldown (IPU/IPD) on these pins are enabled. For PCI multiplexed pins in the GPIO Block, when PCIEN = 0, the pins function as GPIO (GP[3:0]). For PCI multiplexed pins in the Host Block, refer to PINMUX1.HOSTBK field for the actual pin functions. For PCI multiplexed pins in the EMIFA/VPSS Block, refer to PINMUX0.AEM and AEAW fields for the actual pin functions. For PCI pins in the PCI Data Block, when PCIEN = 0, the pins have no function and should be left unconnected. PCIEN = 1: PCI supported. Internal pullup/pulldown (IPU/IPD) on all PCI pins are disabled. All pins function as PCI pins. Applicable *only* for PINMUX0.AEM = 000b or 101b.	**Host Block:** See list of 27 pins in HOSTBK bit field description **PCI Data Block:** AD26 AD28 AD30 **GPIO Block:** AD0/GP[0] AD1/GP[1] AD2/GP[2] AD4/GP[3] **EMIFA/VPSS Sub-Block 0*:** EM_A[13]/AD25/EM_D[0]/GP[51] EM_A[14]/AD27/EM_D[1]/GP[50] EM_A[15]/AD29/EM_D[2]/GP[49] EM_A[16]/PGNT/EM_D[3]/GP[48] EM_A[17]/AD31/EM_D[4]/GP[47] EM_A[18]/PRST/EM_D[5]/GP[46] EM_A[19]/PREQ/EM_D[6]/GP[45] EM_A[20]/PINTA/EM_D[7]/GP[44] **EMIFA/VPSS Sub-Block 3*:** EM_A[12]/PCBE3/GP[89] EM_A[11]/AD24/GP[90] EM_A[10]/AD23/GP[91] EM_A[9]/PIDSEL/GP[92] EM_A[8]/AD21/GP[93] EM_A[7]/AD22/GP[94] EM_A[6]/AD20/GP[95] EM_A[5]/AD19/GP[96] The pin mux for the EMIFA/VPSS Sub-Block 0 and EMIFA/VPSS Sub-Block 3 pins are controlled by a combination of PCIEN and other PINMUX0/1 fields, including HOSTBK, AEM, and AEAW. See Section 3.7.3.13.7, *EMIFA/VPSS Block Pin-By-Pin Multiplexing Summary*, for the full set of valid configurations of EMIFA/VPSS Block pins. For the full set of valid configurations of Host Block pins, see Section 3.7.3.3, *Host Block Muxing*.

3.7.3 Pin Multiplexing Details

This section discusses how to program each Pin Mux Block to select the desired peripheral functions.

The following steps can be used to determine pin muxing suitable for the application:

1. Understand the major configuration choices available for the specific application.
   a. Device Major Configuration Choices: Figure 3-11 shown in Section 3.7, *Multiplexed Pin Configurations*, provides a high-level view of the device pin muxing and can be used to determine the possible mix of peripheral options for a specific application.
   b. EMIFA/VPSS Block Major Configuration Choices: The EMIFA/VPSS block features extensive pin multiplexing to accommodate a variety of applications. In addition to Figure 3-11, Section 3.7.3.13, *EMIFA/VPSS Block Muxing*, provides more details on the Major Configuration choices for this block.
2. See Section 3.7.3.1, *Multiplexed Pins on DM6433*, for a summary of all the multiplexed pins on this device and the pin mux group they belong to.
3. Refer to the individual pin mux sections (Section 3.7.3.3, *Host Block Muxing* to Section 3.7.3.13, *EMIFA/VPSS Block Muxing*) for pin muxing details for a specific pin mux block.
   a. For peripherals that span multiple pin mux blocks, the user must select the appropriate pins for that peripheral in all relevant pin mux blocks. For more details, see Section 3.7.3.2, *Peripherals Spanning Multiple Pin Mux Blocks* .

For details on PINMUX0 and PINMUX1 registers, see Section 3.7.2.

3.7.3.1 Multiplexed Pins on DM6433

Table 3-21 summarizes all of the multiplexed pins on DM6433, the pin mux group for each pin, and the PINMUX register fields that control the pin. For pin mux details, see the specific pin mux group section (Section 3.7.3.3, *Host Block Muxing* to Section 3.7.3.13, *EMIFA/VPSS Block Muxing*). For a description of the PINMUX register fields, see Section 3.7.2.

Note: PINMUX groups EMIFA/VPSS Sub-Block 2 and PCI Data Block are not shown in the above table because there is no actual pin multiplexing in those blocks. But these two blocks are still considered "pin mux blocks" because they contain some of the pins necessary for EMIFA and PCI, respectively. The pins in these blocks are as follows:

- **EMIFA/VPSS Sub-Block 2**
  - EM_WAIT/(RDY/$\overline{\text{BSY}}$)
  - $\overline{\text{EM\_OE}}$
  - $\overline{\text{EM\_WE}}$

3.7.3.2 Peripherals Spanning Multiple Pin Mux Blocks

Some peripherals span multiple Pin Mux Blocks. To use these peripherals, they must be selected in all of the relevant Pin Mux Blocks. The following is the list of peripherals that span multiple Pin Mux Blocks:

- **PCI:** PCI pins span across the Host Block, EMIFA/VPSS Block Sub-Block 0 and Sub-Block 3, PCI Data Block, and GPIO Block. To select PCI pins, program PINMUX registers as follows:
  - **Host Block:** PCIEN = 1, HOSTBK = 000
  - **EMIFA/VPSS Block:** Select either Major Configuration Option F or G. For more details on the PINMUX settings associated with Major Configuration Options F or G, see Section 3.7.3.13, *EMIFA/VPSS BLock Muxing*.
  - **PCI Data Block:** PCIEN = 1
  - **GPIO Block:** PCIEN = 1
- **McBSP0:** Six McBSP0 pins are located in the Serial Port Sub-Block 0, but the CLKS0 pin is muxed in the Timer0 Block. To select McBSP0 pins, program PINMUX registers as follows:
  - **Serial Port Sub-Block 0:** SPBK0 = 01
  - **Timer0 Block:** If CLKS0 pin is desired, program TIM0BK = 10 or 11.
- **UART0:** The two UART0 data pins are located in the UART0 Data Block, but the two UART0 flow control pins are located in the UART0 Flow Control Block. To select UART0, program PINMUX registers as follows:
  - **UART0 Data Block:** UR0BK = 1
  - **UART0 Flow Control Block:** If flow control pins are desired, program UR0FCBK = 01.

3.7.3.3 Host Block Muxing

This block of 27 pins consists of PCI, HPI, VLYNQ, EMAC, MDIO, and GPIO muxed pins. The following register fields select the pin functions in the Host Block:

- PINMUX1.PCIEN
- PINMUX1.HOSTBK

Table 3-22 summarizes the 27 pins in the Host Block, the multiplexed function on each pin, and the PINMUX configurations to select the corresponding function.

Table 3-22. Host Block Muxed Pins Selection

As discussed in Section 3.7.3.2, *Peripherals Spanning Multiple Pin Mux Blocks*, PCI pins span across the following Pin Mux Blocks: Host Block, EMIFA/VPSS Block Sub-Block 0 and Sub-Block 3, PCI Data Block, and GPIO Block. For proper PCI operation, PCI must be selected in all of these Pin Mux Blocks.

Table 3-23 provides a different view of the Host Block pin muxing, showing the Host Block function based on PINMUX1 settings. The selection options are also shown pictorially in Figure 3-11.

If EMAC operation is desired, EMAC must be placed in reset before programming PINMUX1.HOSTBK to select EMAC pins.

Table 3-23. Host Block Function Selection

PINMUX1 SETTING		BLOCK FUNCTION	RESULTING PIN FUNCTIONS
PCIEN(1)	HOSTBK		
1	000	PCI (Default if PCIEN = 1)	**PCI:** PCICLK, $\overline{\text{PCBE2}}$, $\overline{\text{PCBE1}}$, $\overline{\text{PCBE0}}$, $\overline{\text{PFRAME}}$, $\overline{\text{PIDRDY}}$, $\overline{\text{PTRDY}}$, $\overline{\text{PDEVSEL}}$, $\overline{\text{PSTOP}}$, $\overline{\text{PPER}}$, $\overline{\text{PSERR}}$, PPAR, AD[18:05], AD[03] Internal pullup/pulldown on all these pins are disabled.
1	001 to 111	Reserved	Reserved
0	000	GPIO (27) (Default if PCIEN = 0)	**GPIO:** GP[83:57]
0	001	HPI + GPIO (1)	**HPI:** HHWIL, HCNTL[1:0], HR/$\overline{\text{W}}$, $\overline{\text{HDS2}}$, $\overline{\text{HDS1}}$, $\overline{\text{HRDY}}$, $\overline{\text{HCS}}$, $\overline{\text{HINT}}$, $\overline{\text{HAS}}$, HD[15:0] **GPIO:** GP[57]
0	010	VLYNQ + GPIO (17)	**VLYNQ:** VLYNQ_CLOCK, VLYNQ_SCRUN, VLYNQ_RXD[3:0], VLYNQ_TXD[3:0] **GPIO:** GP[83:67]
0	011	VLYNQ + EMAC (MII) + MDIO	**VLYNQ:** VLYNQ_CLOCK, VLYNQ_SCRUN, VLYNQ_RXD[3:0], VLYNQ_TXD[3:0] **EMAC (MII):** TXCLK, CRS, COL, TXD[3:0], RXDV, TXEN, RXER, RXCLK, RXD[3:0] **MDIO:** MDC, MDIO **If EMAC operation is desired, EMAC must be placed in reset before programming PINMUX1.HOSTBK to select EMAC pins.**
0	100	EMAC (MII) + MDIO + GPIO (10)	**EMAC (MII):** TXCLK, CRS, COL, TXD[3:0], RXDV, TXEN, RXER, RXCLK, RXD[3:0] **MDIO:** MDC, MDIO **GPIO:** GP[66:57] **If EMAC operation is desired, EMAC must be placed in reset before programming PINMUX1.HOSTBK to select EMAC pins.**
0	101 to 111	Reserved	Reserved

(1) If PCIEN = 1, the internal pullup/pulldown on all Host Block pins are disabled. If PCIEN = 0, the internal pullup/pulldown on all Host Block pins are enabled.

The PINMUX1.PCIEN field is read-only, and its setting is determined by the PCIEN configuration pin. Based on the PCIEN configuration pin setting, the 27 pins in the Host Block defaults to either PCI or GPIO function.

In addition, the VDD3P3V_PWDN.HOST field determines the power state of the Host Block pins. The Host Block pins default to powered up. For more details on the VDD3P3V_PWDN.HOST field, see Section 3.2, *Power Considerations*.

3.7.3.4 PCI Data Block

This block of 3 pins consists of 3 PCI Address/Data pins—AD30, AD28, AD26. The PINMUX1.PCIEN register field affects the pin functions in the PCI Data Block.

As discussed in Section 3.7.3.2, *Peripherals Spanning Multiple Pin Mux Blocks*, PCI pins span across the following Pin Mux Blocks: Host Block, EMIFA/VPSS Block Sub-Block 0 and Sub-Block 3, PCI Data Block, and GPIO Block. For proper PCI operation, PCI must be selected in all of these Pin Mux Blocks.

The 3 pins in the PCI Data Block are not muxed with any other peripherals. However, the PINMUX1.PCIEN field controls the internal pullup/pulldown resistors on these pins. For PCI operation (PCIEN = 1), the internal pullup/pulldown resistors are disabled. If the device does not support PCI (PCIEN = 0), the internal pullup/pulldown resistors on these pins are enabled so that the user can leave these pins unconnected on the board.

Table 3-24 shows the Host Block pin selection based on PINMUX1.PCIEN setting.

Table 3-24. PCI Data Block Pin Control

PINMUX1.PCIEN	BLOCK FUNCTION	RESULTING PIN FUNCTIONS
0	No Connect Pins (Default if PCIEN = 0)	No Connect Pins *Internal pullup/pulldown enabled. Leave these three pins unconnected on the board.*
1	PCI (Default if PCIEN = 1)	**PCI:** AD26, AD28, AD30

3.7.3.5 GPIO Block Muxing

This block of 4 pins consists of PCI and GPIO muxed pins. The PINMUX1.PCIEN register field selects the pin functions in the GPIO Block.

Table 3-25 summarizes the 4 pins in the GPIO Block, the multiplexed function on each pin, and the PINMUX configurations to select the corresponding function.

Table 3-25. GPIO Block Muxed Pins Selection

SIGNAL	MULTIPLEXED FUNCTIONS			
	PCI		GPIO	
NAME	FUNCTION	SELECT	FUNCTION	SELECT
AD0/GP[0]	AD0	PCIEN = 1 (1)	GP[0]	PCIEN = 0 (1)
AD1/GP[1]	AD1		GP[1]	
AD2/GP[2]	AD2		GP[2]	
AD4/GP[3]	AD4		GP[3]	

(1) If PCIEN = 1, the internal pullup/pulldown on all GPIO Block pins are disabled. If PCIEN = 0, the internal pullup/pulldown on all GPIO Block pins are enabled.

As discussed in Section 3.7.3.2, *Peripherals Spanning Multiple Pin Mux Blocks*, PCI pins span across the following Pin Mux Blocks: Host Block, EMIFA/VPSS Block Sub-Block 0 and Sub-Block 3, PCI Data Block, and GPIO Block. For proper PCI operation, PCI ***must*** be selected in all of these Pin Mux Blocks.

Table 3-26 provides a different view of the GPIO Block pin muxing, showing the GPIO Block function based on PINMUX1.PCIEN setting. The selection options are also shown pictorially in Figure 3-11.

Table 3-26. GPIO Block Function Selection

PINMUX1.PCIEN	BLOCK FUNCTION	RESULTING PIN FUNCTIONS
0	PCI (Default if PCIEN = 1)	**PCI:** AD0, AD1, AD2, AD4
1	GPIO (4) (Default if PCIEN = 0)	**GPIO:** GP[3:0]

The PINMUX1.PCIEN field is read-only, and its setting is determined by the PCIEN configuration pin. Based on the PCIEN configuration pin setting, the 4 pins in the GPIO Block defaults to either PCI or GPIO function.

In addition, the VDD3P3V_PWDN.GPIO field determines the power state of the GPIO Block pins. The GPIO Block pins default to powered up. For more details on the VDD3P3V_PWDN.GPIO field, see Section 3.2, *Power Considerations*.

3.7.3.6 UART0 Data Block Muxing

This block of 2 pins consists of UART0 Data and GPIO muxed pins. The PINMUX1.UR0DBK register field select the pin functions in the UART0 Data Block.

Table 3-27 summarizes the 2 pins in the UART0 Data Block, the multiplexed function on each pin, and the PINMUX configurations to select the corresponding function.

Table 3-27. UART0 Data Block Muxed Pins Selection

SIGNAL	MULTIPLEXED FUNCTIONS			
	UART0		GPIO	
NAME	FUNCTION	SELECT	FUNCTION	SELECT
URXD0/GP[85]	URXD0	UR0DBK = 1	GP[85]	UR0DBK = 0
UTXD0/GP[86]	UTXD0		GP[86]	

As discussed in Section 3.7.3.2, *Peripherals Spanning Multiple Pin Mux Blocks*, the UART0 pins span across two Pin Mux Blocks: UART0 Data Block, and UART0 Flow Control Block. For proper UART0 operation, the two pins in the UART0 Data Block must be configured for UART0 data functions. The two pins in the UART0 Flow Control Block are optional.

Table 3-28 provides a different view of the UART0 Data Block pin muxing, showing the UART0 Data Block function based on PINMUX1.UR0DBK setting. The selection options are also shown pictorially in Figure 3-11.

Table 3-28. UART0 Data Block Function Selection

PINMUX1.UR0DBK	BLOCK FUNCTION	RESULTING PIN FUNCTIONS
0	GPIO (2) (**default**)	**GPIO:** GP[86:85]
1	UART0 Data	**UART0:** URXD0, UTXD0

In addition, the VDD3P3V_PWDN.UR0DAT field determines the power state of the UART0 Data Block pins. The UART0 Data Block pins default to powered down and not operational. To use these pins, user must first program VDD3P3V_PWDN.UR0DAT = 0 to power up the pins. For more details on the VDD3P3V_PWDN.UR0DAT field, see Section 3.2, *Power Considerations*.

The UART0 Data Block features internal pullup resistors, which matches the UART inactive polarity.

3.7.3.7 UART0 Flow Control Block

This block of 2 pins consists of UART0 Flow Control, PWM0, and GPIO muxed pins. The PINMUX1.UR0FCBK register field selects the pin functions in the UART0 Flow Control Block.

Table 3-29 summarizes the 2 pins in the UART0 Flow Control Block, the multiplexed function on each pin, and the PINMUX configurations to select the corresponding function.

Table 3-29. UART0 Flow Control Block Muxed Pins Selection

SIGNAL	MULTIPLEXED FUNCTIONS					
	UART0		PWM0		GPIO	
NAME	FUNCTION	SELECT	FUNCTION	SELECT	FUNCTION	SELECT
UCTS0/ GP[87]	UCTS0	UR0FCBK = 01	–	–	GP[87]	UR0FCBK = 00/10
URTS0/ PWM0/ GP[88]	URTS0		PWM0	UR0FCBK = 10	GP[88]	UR0FCBK = 00

As discussed in Section 3.7.3.2, *Peripherals Spanning Multiple Pin Mux Blocks*, the UART0 pins span across two Pin Mux Blocks: UART0 Data Block, and UART0 Flow Control Block. For proper UART0 operation, the two pins in the UART0 Data Block must be configured for UART0 data functions. The two pins in the UART0 Flow Control Block are optional.

Table 3-30 provides a different view of the UART0 Flow Control Block pin muxing, showing the UART0 Flow Control Block function based on PINMUX1.UR0FCBK setting. The selection options are also shown pictorially in Figure 3-11.

Table 3-30. UART0 Flow Control Block Function Selection

PINMUX1.UR0FCBK	BLOCK FUNCTION	RESULTING PIN FUNCTIONS
00	GPIO (2) (**default**)	**GPIO:** GP[88:87]
01	UART0 Flow Control	**UART0:** UCTS0, URTS0
10	PWM0 + GPIO (1)	**PWM0:** PWM0 **GPIO:** GP[87]
11	Reserved	Reserved

In addition, the VDD3P3V_PWDN.UR0FC field determines the power state of the UART0 Flow Control Block pins. The UART0 Flow Control Block pins default to powered down and not operational. To use these pins, user must first program VDD3P3V_PWDN.UR0FC = 0 to power up the pins. For more details on the VDD3P3V_PWDN.UR0FC field, see Section 3.2, *Power Considerations*.

The UART0 Flow Control Block features internal pullup resistors, which matches the UART inactive polarity.

3.7.3.8 Timer0 Block

This block of 2 pins consists of Timer0, McBSP0, and GPIO muxed pins. The PINMUX1.TIM0BK register field selects the pin functions in the Timer0 Block.

Table 3-31 summarizes the 2 pins in the Timer0 Block, the multiplexed function on each pin, and the PINMUX configurations to select the corresponding function.

Table 3-31. Timer0 Block Muxed Pins Selection

SIGNAL	MULTIPLEXED FUNCTIONS					
	McBSP		Timer0		GPIO	
NAME	FUNCTION	SELECT	FUNCTION	SELECT	FUNCTION	SELECT
TINP0L/ GP[98]	–	–	TINP0L	TIM0BK = 01/11	GP[98]	TIM0BK = 00
CLKS0/ TOUT0L/ GP[97]	CLKS0	TIM0BK = 11	TOUT0L	TIM0BK = 01	GP[97]	

As discussed in Section 3.7.3.2, *Peripherals Spanning Multiple Pin Mux Blocks*, the McBSP0 pins span across two Pin Mux Blocks: Serial Port Sub-Block0, and Timer0 Block. For proper McBSP0 operation, the Serial Port Sub-Block0 must be programmed to select McBSP0 function. The McBSP0 CLKS0 pin in the Timer0 Block is optional for McBSP0 operation. CLKS0 is only needed if you desire using CLKS0 as an external clock source to the McBSP0 internal sample rate generator.

Table 3-32 provides a different view of the Timer0 Block pin muxing, showing the Timer0 Block function based on PINMUX1.TIM0BK setting. The selection options are also shown pictorially in Figure 3-11.

Table 3-32. Timer0 Block Function Selection

PINMUX1.TIM0BK	BLOCK FUNCTION	RESULTING PIN FUNCTIONS
00	GPIO (2) (**default**)	**GPIO:** GP[98:97]
01	Timer0	**Timer0:** TINP0L, TOUT0L
10	Reserved	Reserved
11	McBSP0 External Clock Source, Timer0 Input	**McBSP0:** CLKS0 **Timer0:** TINP0L

In addition, the VDD3P3V_PWDN.TIMER0 field determines the power state of the Timer0 Block pins. The Timer0 Block pins default to powered down and not operational. To use these pins, user must first program VDD3P3V_PWDN.TIMER0 = 0 to power up the pins. For more details on the VDD3P3V_PWDN.TIMER0 field, see Section 3.2, *Power Considerations*.

3.7.3.9 Timer1 Block

This block of 2 pins consists of Timer1 and GPIO muxed pins. The PINMUX1.TIM1BK register field selects the pin functions in the Timer1 Block.

Table 3-33 summarizes the 2 pins in the Timer1 Block, the multiplexed function on each pin, and the PINMUX configurations to select the corresponding function.

Table 3-33. Timer1 Block Muxed Pins Selection

SIGNAL NAME	MULTIPLEXED FUNCTIONS			
	TIMER1		GPIO	
	FUNCTION	SELECT	FUNCTION	SELECT
TINP1L/ GP[56]	TINP1L	TIM1BK = 01	GP[56]	TIM1BK = 00
TOUT1L/ GP[55]	TOUT1L		GP[55]	

Table 3-34 provides a different view of the Timer1 Block pin muxing, showing the Timer1 Block function based on PINMUX1.TIM1BK setting. The selection options are also shown pictorially in Figure 3-11.

Table 3-34. Timer1 Block Function Selection

PINMUX1.TIM1BK	BLOCK FUNCTION	RESULTING PIN FUNCTIONS
00	GPIO (2) (**default**)	**GPIO:** GP[56:55]
01	Timer1	**Timer1:** TINP1L, TOUT1L
10	Reserved	Reserved
11	Reserved	Reserved

In addition, the VDD3P3V_PWDN.TIMER1 field determines the power state of the Timer1 Block pins. The Timer1 Block pins default to powered down and not operational. To use these pins, user must first program VDD3P3V_PWDN.TIMER1 = 0 to power up the pins. For more details on the VDD3P3V_PWDN.TIMER1 field, see Section 3.2, *Power Considerations*.

The Timer1 Block features internal pullup resistors.

3.7.3.10 Serial Port Block

This block of 12 pins consists of McASP0, McBSP0, and GPIO muxed pins. The following register fields select the pin functions in the Serial Port Block:

- PINMUX1.SPBK0
- PINMUX1.SPBK1

The Serial Port Block is further subdivided into these sub-blocks:

- Serial Port Sub-Block 0: McBSP0, part of McASP0, GPIO.
- Serial Port Sub-Block 1: part of McASP0, GPIO.

Table 3-35 summarizes the 12 pins in the Serial Port Block, the multiplexed function on each pin, and the PINMUX configurations to select the corresponding function.

Table 3-35. Serial Port Block Muxed Pins Selection

SIGNAL NAME	MULTIPLEXED FUNCTIONS					
	McASP0		McBSP0		GPIO	
	FUNCTION	SELECT	FUNCTION	SELECT	FUNCTION	SELECT
Serial Port Sub-block 0						
ACLKR0/CLKX0/GP[99]	ACLKR0	SPBK0 = 10	CLKX0	SPBK0 = 01	GP[99]	SPBK0 = 00
AFSR0/DR0/GP[100]	AFSR0		DR0		GP[100]	
AHCLKR0/CLKR0/GP[101]	AHCLKR0		CLKR0		GP[101]	
AXR0[3]/FSR0/GP[102]	AXR0[3]		FSR0		GP[102]	
AXR0[2]/FSX0/GP[103]	AXR0[2]		FSX0		GP[103]	
AXR0[1]/DX0/GP[104]	AXR0[1]		DX0		GP[104]	
Serial Port Sub-block 1						
AXR0[0]/GP[105]	AXR0[0]	SPBK1 = 10	–	–	GP[105]	SPBK1 = 00
ACLKX0/GP[106]	ACLKX0	SPBK1 = 10			GP[106]	
AFSX0/GP[107]	AFSX0	SPBK1 = 10			GP[107]	
AHCLKX0/GP[108]	AHCLKX0	SPBK1 = 10			GP[108]	
AMUTEIN0/GP[109]	AMUTEIN0	SPBK1 = 10			GP[109]	
AMUTE0/GP[110]	AMUTE0	SPBK1 = 10			GP[110]	

As discussed in Section 3.7.3.2, *Peripherals Spanning Multiple Pin Mux Blocks*, the McBSP0 pins span across two Pin Mux Blocks: Serial Port Sub-Block0, and Timer0 Block. For proper McBSP0 operation, the Serial Port Sub-Block0 must be programmed to select McBSP0 function. The McBSP0 CLKS0 pin in the Timer0 Block is optional for McBSP0 operation. CLKS0 is only needed if you desire using CLKS0 as an external clock source to the McBSP0 internal sample rate generator.

Table 3-36 and Table 3-37 provide a different view of the Serial Port Block. Table 3-36 shows the Serial Port Sub-Block 0 function based on PINMUX1.SPBK0 setting. Table 3-37 shows the Serial Port Sub-Block 1 function based on PINMUX1.SPBK1 setting. These selection options are also shown pictorially in Figure 3-11.

Table 3-36. Serial Port Sub-Block 0 Function Selection

PINMUX1.SPBK0	BLOCK FUNCTION	RESULTING PIN FUNCTIONS
00	GPIO (6) (**default**)	**GPIO:** GP[104:99]
01	McBSP0	**McBSP0:** CLKX0, FSX0, DX0, CLKR0, FSR0, DR0
10	McASP0 Receive, 3 Serializers	**McASP0:** ACLKR0, AFSR0, AHCLKR0, AXR0[3], AXR0[2], AXR0[1]
11	Reserved	Reserved

Table 3-37. Serial Port Sub-Block 1 Function Selection

PINMUX1.SPBK1	BLOCK FUNCTION	RESULTING PIN FUNCTIONS
00	GPIO (6) (**default**)	**GPIO:** GP[110:105]
01	Reserved	Reserved
10	McASP0 Transmit with 1 Serializer and Mute Control	**McASP0:** AXR0[0], ACLKX0, AFSX0, AHCLKX0, AMUTEIN0(1), AMUTE0
11	Reserved	Reserved

(1) The input from the AMUTEIN0/GP[109] pin is connected to both the McASP0 and GPIO.

In addition, the VDD3P3V_PWDN.SP field determines the power state of the Serial Port Block pins. The Serial Port Block pins default to powered down and not operational. To use these pins, user must first program VDD3P3V_PWDN.SP = 0 to power up the pins. For more details on the VDD3P3V_PWDN.SP field, see Section 3.2, *Power Considerations*.

To facilitate McASP0 operation, the input from the AMUTEIN0/GP[109] pin is connected to both the McASP0 and the GPIO module. Therefore when an external mute event occurs, in addition to notifying the McASP0, it can also cause an interrupt through the GPIO module.

3.7.3.11 PWM1 Block

This block of 1 pin consists of PWM1 and GPIO muxed pins (GP[4]/PWM1). The PINMUX1.PWM1BK register field selects the pin function in the PWM1 Block.

Table 3-38 summarizes the 1 pin in the PWM1 Block, its multiplexed function, and the PINMUX configurations to select the corresponding function.

Table 3-38. PWM1 Block Muxed Pin Selection

SIGNAL	MULTIPLEXED FUNCTIONS			
	PWM1		GPIO	
NAME	FUNCTION	SELECT	FUNCTION	SELECT
GP[4]/PWM1	PWM1	PWM1BK = 1	GP[4]	PWM1BK = 0

Table 3-39 provides a different view of the PWM1 Block pin muxing, showing the PWM1 Block function based on PINMUX1.PWM1BK setting. The selection options are also shown pictorially in Figure 3-11.

Table 3-39. PWM1 Block Function Selection

PINMUX1.PWM1BK	BLOCK FUNCTION	RESULTING PIN FUNCTIONS
0	GPIO (1) (**default**)	**GPIO:** GP[4]
1	PWM1	**PWM1:** PWM1

In addition, the VDD3P3V_PWDN.PWM1 field determines the power state of the PWM1 Block pin. The PWM1 Block pin defaults to powered down and not operational. To use this pin, user must first program VDD3P3V_PWDN.PWM1 = 0 to power up the pin. For more details on the VDD3P3V_PWDN.PWM1 field, see Section 3.2, *Power Considerations*.

3.7.3.12 CLKOUT Block

This block of 1 pin consists of CLKOUT, PWM2, and GPIO muxed pin (CLKOUT0/PWM2/GP[84]). The PINMUX1.CKOBK register field selects the pin function in the CLKOUT Block.

Table 3-40 summarizes the 1 pin in the CLKOUT Block, its multiplexed function, and the PINMUX configurations to select the corresponding function.

Table 3-40. CLKOUT Block Multiplexed Pin Selection

SIGNAL	MULTIPLEXED FUNCTIONS					
	CLKOUT0		PWM2		GPIO	
NAME	FUNCTION	SELECT	FUNCTION	SELECT	FUNCTION	SELECT
CLKOUT0/ PWM2/ GP[84]	CLKOUT0	CKOBK = 01	PWM2	CKOBK = 10	GP[84]	CKOBK = 00

Table 3-41 provides a different view of the CLKOUT Block pin muxing, showing the CLKOUT Block function based on PINMUX1.CKOBK setting. The selection options are also shown pictorially in Figure 3-11.

Table 3-41. CLKOUT Block Function Selection

PINMUX1.CKOBK	BLOCK FUNCTION	RESULTING PIN FUNCTIONS
00	GPIO (1)	**GPIO:** GP[84]
01	CLKOUT (**default**)	**Device Clock-Out:** CLKOUT0
10	PWM2	**PWM2:** PWM2
11	Reserved	Reserved

This block defaults to CLKOUT0 pin function.

In addition, the VDD3P3V_PWDN.CLKOUT field determines the power state of the CLKOUT Block pin. The CLKOUT Block pin defaults to powered up. For more details on the VDD3P3V_PWDN.CLKOUT field, see Section 3.2, *Power Considerations*.

3.7.3.13 EMIFA/VPSS Block Muxing

This block of 61 pins consists of VPSS, EMIFA, PCI, and GPIO muxed pins. The following register fields affect the pin functions in the EMIFA/VPSS Block:

- All PINMUX0 register fields: AEM, VENCSEL, CS5SEL, CS4SEL, CS3SEL, RGBSEL, VPBECKEN, and AEAW
- PINMUX1.PCIEN

The EMIFA/VPSS Block is divided into multiple sub-blocks for ultimate flexibility in pin multiplexing to accommodate a wide variety of applications:

- Sub-Block 0: multiplexed between EMIFA data/address/control pins, PCI, and GPIO.
- Sub-Block 1: multiplexed between VPBE, EMIFA data/address/control pins, and GPIO.
- Sub-Block 2: no multiplexing. EMIFA control pins EM_WAIT/(RDY/$\overline{\text{BSY}}$), $\overline{\text{EM\_OE}}$, $\overline{\text{EM\_WE}}$.
- Sub-Block 3: multiplexed between EMIFA address pins EM_A[12:6], PCI, and GPIO.

As discussed in Section 3.7.3.2, *Peripherals Spanning Multiple Pin Mux Blocks*, PCI pins span across the following Pin Mux Blocks: Host Block, EMIFA/VPSS Block Sub-Block 0 and Sub-Block 3, PCI Data Block, and GPIO Block. For proper PCI operation, PCI must be selected in all of these Pin Mux Blocks.

The EMBK0, EMBK1, EMBK2, EMBK3 fields in the VDD3P3V_PWDN register determine the power state of the EMIFA/VPSS Block pins. The EMIFA/VPSS Block pins default to powered up. For more details on the EMBK0, EMBK1, EMBK2, EMBK3 fields in the VDD3P3V_PWDN register, see Section 3.2, *Power Considerations*.

To understand pin multiplexing in the EMIFA/VPSS Block, the user should start with Section 3.7.3.13.1, *EMIFA/VPSS Block Pin Selection Procedure*, which outlines the procedures to select pin functions of this block. Section 3.7.3.13.7, *EMIFA/VPSS Block Pin-By-Pin Multiplexing Summary*, provides a pin-by-pin multiplexing summary for the EMIFA/VPSS Block. For more information on the PINMUX0 and PINMUX1 registers, see Section 3.7.2, *Pin Muxing Selection After Device Reset*.

3.7.3.13.1 EMIFA/VPSS Block Pin Selection Procedure

Follow the steps below to perform pin selection for the EMIFA/VPSS Block and its sub-blocks.

1. **Major Configuration Options**: start with Table 3-42, *EMIFA/VPSS Block Major Configuration Choices*. Based on the peripheral needs, the user should select from the major configuration options in this block: Major Config Options A, B, C, D, E, F, G.
2. **Sub-Block 0, Sub-Block 2, and Sub-Block 3 Selection**: After selecting the major configuration option from Table 3-42, *EMIFA/VPSS Block Major Configuration Choices*, the pin selection for Sub-Block 0, Sub-Block 2, and Sub-Block 3 is complete.
3. **Sub-Block 1 Selection**: Use Table 3-44 through Table 3-48, *EMIFA/VPSS Sub-Block 1 Configuration Choices*, to refine Sub-Block 1 pin selection.
   a. Go to the table with the Major Configuration Option chosen in Step 1.
   b. Each Major Configuration Option is further divided down into multiple Minor Configuration Options. Select a Minor Configuration Option that best suits the application need.
   c. Within the chosen Minor Configuration Option, further refine the detailed pin configurations by selecting the settings of PINMUX0 fields VENCSEL, RGBSEL, CS3SEL, CS4SEL, and CS5SEL.
   d. The *Selection Fields* columns shows the settings needed to program the PINMUX0 register.

After following the procedure in this section to determine pin functions for the EMIFA/VPSS Block, the user should refer to Section 3.7.3.13.7, *EMIFA/VPSS Block Pin-By-Pin Multiplexing Summary*, for pin-multiplexing information on a pin-by-pin basis.

3.7.3.13.2 EMIFA/VPSS Block Major Configuration Choices

Table 3-42 shows the major configuration choices in the EMIFA/VPSS Block. For instructions on how to use the *EMIFA/VPSS Block Major Configuration Choices* table for the EMIFA/VPSS Block and Sub-Blocks, see Section 3.7.3.13.1.

Table 3-42. EMIFA/VPSS Block Major Configuration Choices

MAJOR CONFIG. OPTION	PINMUX SELECTION FIELDS(1)			RESULTING PERIPHERALS/PINS				
	PCIEN	AEM	VENCSEL	PCI(2)	EMIFA	VPBE AND # GP PINS (FROM GP[33:5])		# GP PINS (FROM GP[54:34])
						VENCSEL	VPBE & # GP Pins	# GP Pins
A	0	000	00, 01, 10	-	-	00	No VENC 29 GP pins	21 GP pins
						01	8-bit VENC 8-to-29-GP pins	
						10	16-to-24-bit VENC 0-to-12 GP pins	
B	0	001(3)	00, 01	-	8-bit EMIFA (ASYNC) Pinout Mode 1 *with address pins to support 16MB per CS.*	00	No VENC 9-to-13 GP pins	11 GP pins
						01(3)	8-bit VENC(3) 0-to-4 GP pins	
C	0	011(3)	00, 10	-	8-bit EMIFA (ASYNC) Pinout Mode 3 *with address pins to support up to 32KB per CS.*	00	No VENC 17-to-21 GP pins	12 GP pins
						10(3)	16-bit VENC(3) 0-to-4 GP pins	
D	0	100	00, 01, 10	-	8-bit EMIFA (NAND) Pinout Mode 4	00	No VENC 22-to-26 GP pins	13 GP pins
						01	8-bit VENC 12-to-17 GP pins	
						10	16-to-18-bit VENC 2-to-9 GP pins	
E	0	101	00, 01	-	8-bit EMIFA (NAND) Pinout Mode 5	00	No VENC 14-to-18 GP pins	21 GP pins
						01	8- bit VENC 4-to-9 GP pins	
F	1	000	00, 01, 10	PCI	-	00	No VENC 29 GP pins	13 GP pins
						01	8-bit VENC 8-to-29 GP pins	
						10	16-to-24-bit VENC 0-to-12 GP pins	
G	1	101	00, 01	PCI	8-bit EMIFA (NAND) Pinout Mode 5	00	No VENC 14-to-18 GP pins	13 GP pins
						01	8-bit VENC 4-to-9 GP pins	

(1) For additional pin mux details for each Sub-Block, see Table 3-44 through Table 3-48, *EMIFA/VPSS Sub-Block 1 Configuration Choices*.
(2) PCI pins span across multiple Pin Mux Blocks (Section 3.7.3.2, *Peripherals Spanning Multiple Pin Mux Blocks*). This table only refers to the PCI pins in the EMIFA/VPSS Block.
(3) If PINMUX0.AEM = 001 or 011, it is not possible to get LCD_FIELD pin for VPBE.

As shown in Table 3-42, the major configuration choices of the EMIFA/VPSS Block are determined by the following PINMUX register fields:

- PINMUX1 register field PCIEN
- PINMUX0 register fields AEM and VENCSEL

Based on the peripheral needs, select from the major configuration options in this block: Major Configuration Options A, B, C, D, E, F, and G.

The following is an example on how to read Table 3-42. For example, the "PINMUX Selection Fields" columns indicate that Major Configuration Choice B is selected through setting PINMUX1.PCIEN = 0, PINMUX0.AEM = 1, and VENCSEL = 0 or 1 (based on the system's VPBE requirement). The "Resulting Peripherals/Pins" columns indicate that Major Configuration Option B can support the following combination of pin functions:

- No PCI pins
- Pins for 8-bit EMIFA (Async or NAND) function. The number of address pins supported provide 16MByte address reach per EMIFA Chip Select (CS) space.
- Pins for up to 8-bit VPBE. If 8-bit VPBE (VENCSEL = 1) is selected, the user may have 0 to 4 GPIO pins. Exact detail on number of GPIO pins and VPBE control pins is further determined by other PINMUX0 settings discussed in the EMIFA/VPSS Sub-Block 1 Configuration Choices.
- 11 GPIO pins (GP[54:52, 43:36]) from EMIFA/VPSS Sub-Block 0.

After using Table 3-42 to select the Major Configuration Option for the EMIFA/VPSS Block, proceed to select the detailed pin choices in the EMIFA/VPSS Sub-Blocks.

3.7.3.13.3 EMIFA/VPSS Sub-Block 0 Configuration Choices

The pins in the EMIFA/VPSS Sub-Block 0 are muxed between part of EMIFA, part of PCI, and GPIO. The pin functions in the EMIFA/VPSS Sub-Block 0 are determined by the following PINMUX register fields:

- PINMUX1.PCIEN
- PINMUX0:AEM, AEAW (***must*** be set to 100b)

Once the Major Configuration Option for the EMIFA/VPSS Block has been selected (see Section 3.7.3.13.2, *EMIFA/VPSS Block Major Configuration Choices*), no further actions are necessary to refine the EMIFA/VPSS Sub-Block 0 pin selection. For instructions on the procedures to configure the EMIFA/VPSS Block, see Section 3.7.3.13.1, *EMIFA/VPSS Block Pin Selection Procedure*.

Table 3-43 summarizes the pin selections in the EMIFA/VPSS Sub-Block 0 based on the PINMUX selections.

Table 3-43. EMIFA/VPSS Sub-Block 0 Configuration Choices

	PINMUX SELECTION FIELDS			RESULTING PERIPHERALS/PINS		
MAJOR CONFIG OPTION	**PCIEN**	**AEM**	**AEAW**	**PCI**	**EMIFA**	**GPIO**
A	0	000	N/A	–	–	**21 GP pins:** GP[54:34]
B	0	001(1)	100	–	**8-bit EMIFA (Async) Pinout Mode 1** EM_R/$\overline{W}$ EM_A[21:13]	**11 GP pins:** GP[54:52], GP[43:36]
C	0	011	N/A	–	**8-bit EMIFA (Async) Pinout Mode 3** EM_R/$\overline{W}$ EM_D[7:0]	**12 GP pins:** GP[54:52], GP[43:36], GP[34]
D	0	100	N/A	–	**8-bit EMIFA (NAND) Pinout Mode 4** EM_D[7:0]	**13 GP pins:** GP[54:52], GP[43:36], GP[35:34]
E	0	101	N/A	–	**8-bit EMIFA (NAND) Pinout Mode 5** No EMIFA pins from Sub-Block 0	**21 GP pins:** GP[54:34]
F	1	000	N/A	PCI: $\overline{REQ}$, $\overline{INTA}$, $\overline{RST}$, $\overline{GNT}$, AD31, AD29, AD27, AD25	–	**13 GP pins:** GP[54:52], GP[43:36], GP[35:34]
G	1	101	N/A	PCI: $\overline{REQ}$, $\overline{INTA}$, $\overline{RST}$, $\overline{GNT}$, AD31, AD29, AD27, AD25	**8-bit EMIFA (NAND) Pinout Mode 5** No EMIFA pins from Sub-Block 0	**13 GP pins:** GP[54:52], GP[43:36], GP[35:34]

(1) For AEM = 001, AEAW ***must*** be set to 100b. For AEM = 000, 011, 100, or 101, AEAW is "don't care".

3.7.3.13.4 EMIFA/VPSS Sub-Block 1 Configuration Choices

Table 3-44 through Table 3-48 show the configuration choices in the EMIFA/VPSS Sub-Block 1. For instructions on how to use the different configuration choices tables for the EMIFA/VPSS Block and Sub-Blocks, see Section 3.7.3.13.1, *EMIFA/VPSS Block Pin Selection Procedure*.

Before using Table 3-44 through Table 3-48 to configure the details of the EMIFA/VPSS Sub-Block 1, the user should first select the Major Configuration Option for the EMIFA/VPSS Block (see Section 3.7.3.13.2, *EMIFA/VPSS Block Major Configuration Choices*). After determining the Major Configuration Option (A, B, C, D, E, F, or G), the user can now use Table 3-44 through Table 3-48 to refine the Sub-Block 1 pin selections.

1. Go to the table with the Major Configuration Option chosen from Table 3-42.
2. Each Major Configuration Option is further divided down into multiple Minor Configuration Options. Select a Minor Configuration Option that best suits the application need.
3. Within the chosen Minor Configuration Option, further refine the detailed pin configurations by selecting the settings of PINMUX0 fields VENCSEL, RGBSEL, CS3SEL, CS4SEL, CS5SEL, and VPBECKEN.
4. The *PINMUX Selection Fields* columns give the user the settings needed to program the PINMUX0 register.

Table 3-44. EMIFA/VPSS Sub-Block 1 Configuration Choices A and F[1]

MAJOR CONFIG OPTION	MINOR CONFIG OPTION	PINMUX SELECTION FIELDS		RESULTING PERIPHERALS/PINS		
		AEM	OTHERS	EMIFA	VPBE	GPIO
A, F	A1, F1	000	**Cfg Summary**	**No EMIFA**	**No VENC**	**29 GP pins**
			VENCSEL = 0	-	-	0 = GP[31, 29:14]
			RGBSEL = 0			0 = GP[12:5]
			CS3SEL = 0			0 = GP[13]
			CS4SEL = 0			0 = GP[32]
			CS5SEL = 0			0 = GP[33]
			VPBECKEN = 0			0 = GP[30]
	A2, F2	000	**Cfg Summary**	**No EMIFA**	**8-bit VENC**	**8 to 29 GP pins**
			VENCSEL = 1	-	1 = VCLK, YOUT[7:0]	1 = GP[21:14]

			VPBECKEN = 0,1	-	1 = VPBECLK	0 = GP[30]

(1) Italics indicate mandatory setting for a given Minor Configuration option.

As shown in Table 3-44 through Table 3-48, the configuration choices of the EMIFA/VPSS Sub-Block 1 are determined by the following PINMUX register fields:

- PINMUX0 register fields AEM, VENCSEL, RGBSEL, CS3SEL, CS4SEL, CS5SEL, and VPBECKEN.

The following is an example on how to read Table 3-44 through Table 3-48 using Sub-Block 1 Minor Configuration G2 as an example:

- The *PINMUX Selection Fields* columns indicate that Sub-Block 1 Minor Configuration Option G2 is selected through setting PINMUX0 fields to AEM = 5, VENCSEL = 1, RGBSEL = 0 or 1 (based on whether the VPBE LCD_FIELD pin is needed), CS3SEL = 0/1/2 (based on the desired pin choice), CS4SEL = 0/1/2 (based on the desired pin choice), CS5SEL = 0/1/2 (based on the desired pin choice), and VPBECKEN = 0/1 (based on whether VPBE VPBECLK is needed).
- The *Resulting Peripherals/Pins* columns show the functional pins resulting from the PINMUX setting. For example, PINMUX0.VENCSEL = 1 gives you the VCLK and YOUT[7:0] pins for the VPBE, in addition to EM_D[7:0] pins for the EMIFA. PINMUX0.RGBSEL = 1 gives you the LCD_FIELD pin for the VPBE, along with EM_A[2:1] and EM_CS2 for the EMIFA, and 4 GP pins.

3.7.3.13.5 EMIFA/VPSS Sub-Block 2 Configuration Choices

The 3 pins in the EMIFA/VPSS Sub-Block 2 are standalone (non-multiplexed) pins. They always function as EMIFA control pins EM_WAIT/(RDY/$\overline{\text{BSY}}$), $\overline{\text{EM\_OE}}$, and $\overline{\text{EM\_WE}}$. No pin mux selection is necessary for this Sub-Block.

3.7.3.13.6 EMIFA/VPSS Sub-Block 3 Configuration Choices

The 8 pins in the EMIFA/VPSS Sub-Block 3 are multiplexed between:

- EMIFA Address Pins EM_A[12:5]
- PCI pins: $\overline{\text{PCBE3}}$, $\overline{\text{PIDSEL}}$, AD[24:19]
- GPIO pins GP[96:89]

The pin functions in the EMIFA/VPSS Sub-Block 3 are determined by the following PINMUX register fields:

- PINMUX1.PCIEN
- PINMUX0.AEM

Once the Major Configuration Option for the EMIFA/VPSS Block (see Section 3.7.3.13.2, *EMIFA/VPSS Block Major Configuration Choices*) is chosen, no further actions are necessary to refine the EMIFA/VPSS Sub-Block 3 pin selection. For instructions on configuring the EMIFA/VPSS Block, see Section 3.7.3.13.1, *EMIFA/VPSS Block Pin Selection Procedure*.

Table 3-49 summarizes the pin selections in the EMIFA/VPSS Sub-Block 3 based on the PINMUX selections.

Table 3-49. EMIFA/VPSS Sub-Block 3 Configuration Choices

MAJOR CONFIG OPTION	PINMUX SELECTION FIELDS		RESULTING PERIPHERALS/PINS		
	PCIEN	AEM	PCI	EMIFA	GPIO
A	0	000	-	-	GP[96:89]
B	0	001	-	EM_A[12:5]	-
C	0	011	-	EM_A[12:5]	-
D	0	100	-	-	GP[96:89]
E	0	101	-	-	GP[96:89]
F	1	000	$\overline{\text{PCBE3}}$, PIDSEL, AD[24:19]	-	-
G	1	101	$\overline{\text{PCBE3}}$, PIDSEL, AD[24:19]	-	-

The following is an example on how to read Table 3-49 using Sub-Block 3 Major Configuration C as an example:

- The *PINMUX Selection Fields* columns indicate that Sub-Block 3 Major Configuration Option C is selected through PINMUX1.PCIEN = 0 and PINMUX0.AEM = 3.
- The *Resulting Peripherals/Pins* columns show the functional pins resulting from the PINMUX setting. In Major Configuration C, the user gets EMIFA address pins EM_A[12:5] from Sub-Block 3.

3.7.3.13.7 EMIFA/VPSS Block Pin-By-Pin Multiplexing Summary

This section summarizes the EMIFA/VPSS Block muxing on a pin-by-pin basis. It provides an alternative view to pin muxing in the EMIFA/VPSS Block. This section should only be used after following the procedures listed in Section 3.7.3.13.1 to determine the actual EMIFA/VPSS Configuration Option for the application need.

Table 3-50 shows the pin multiplexing control for each pin in the EMIFA/VPSS Sub-Block 0. These are the fields in the PINMUX0 and PINMUX1 registers that control the multiplexing in this sub-block:

- PINMUX0: AEM and AEAW
- PINMUX1: PCIEN

Table 3-51 shows the pin multiplexing control for each pin in the EMIFA/VPSS Sub-Block 1. These are the fields in the PINMUX0 register that control the multiplexing in this sub-block:

- PINMUX0: AEM, VENCSEL, RGBSEL, CS5SEL, CS4SEL, CS3SEL, VPBECKEN

EMIFA/VPSS Sub-Block 2 is dedicated to EMIFA pins EM_WAIT/(RDY/$\overline{BSY}$), $\overline{EM\_OE}$, and $\overline{EM\_WE}$. There is no pin multiplexing in this block. These pins always function as EMIFA control pins.

Table 3-52 shows the pin multiplexing control for each pin in the EMIFA/VPSS Sub-Block 3. These are the fields in the PINMUX0 and PINMUX1 registers that control the multiplexing in this sub-block:

- PINMUX0: AEM
- PINMUX1: PCIEN

3.8 Device Initialization Sequence After Reset

Software should follow this initialization sequence after coming out of device reset.

1. Complete the boot sequence as needed. For more details on the boot sequence, see the *Using the TMS320DM643x Bootloader* Application Report (literature number SPRAAG0).
2. If the device is not already at the desired operating frequency, program the PLL Controllers (PLLC1 and PLLC2) to configure the device frequency. For details on how to program the PLLC, see the *TMS320DM643x DMP DSP Subsystem* Reference Guide (literature number SPRU978).
3. Program PINMUX0 and PINMUX1 registers to select device pin functions. For more details on programming the PINMUX0 and PINMUX1 registers to select device pin functions, see Section 3.7, *Multiplexed Pin Configurations*.
   Note: If EMAC operation is desired, the EMAC **must** be placed in reset before programming PINMUX1.HOSTBK to select EMAC pins.
4. Program the VDD3P3V_PWDN register to power up the necessary I/O pins. For more details on programming the VDD3P3V_PWDN register, see Section 3.2, *Power Considerations*.
5. As needed by the application, program the following System Module registers when there are no active transactions on the respective peripherals:
   a. HPICTL (Section 3.6.2.1, *HPI Control Register*): applicable for HPI **only** if a different host burst write timeout value from default is desired.
   b. TIMERCTL (Section 3.6.2.2, *Timer Control Register*): applicable for Timer0 and Watchdog Timer2 **only**.
   c. EDMATCCFG (Section 3.6.2.3, *EDMA TC Configuration Register*): applicable for EDMA **only**. The recommendation is to leave the EDMATCCFG register at its default.
   d. VPSS_CLKCTL (Section 3.3.1.2.1, *VPSS Clocks*): applicable for VPSS **only**.
6. Program the Power and Sleep Controller (PSC) to enable the desired peripherals. For details on how to program the PSC, see the *TMS320DM643x DMP DSP Subsystem* Reference Guide (literature number SPRU978).
7. Program the Switched Central Resource (SCR) bus priorities for the master peripherals (Section 3.6.1). This **must** be configured when there are no active transactions on the respective peripherals:
   a. Program the MSTPRI0 and MSTPRI1 registers in the System Module. These registers can be programmed **before or after** the respective peripheral is enabled by the PSC in step 6.
   b. Program the EDMACC QUEPRI register, the C64x+ MDMAARBE.PRI field, and the VPSS PCR register. These registers can only be programmed **after** the respective peripheral is enabled by the PSC in step 6.
8. Configure the C64x+ Megamodule and the peripherals.
   a. For details on C64x+ Megamodule configuration, see the *TMS320C64x+ DSP Megamodule* Reference Guide (literature number SPRU871).

   Special considerations: Bootloader disables C64x+ cache—For all boot modes that default to DSPBOOTADDR = 0x0010 0000 (i.e., all boot modes except the EMIFA ROM Direct Boot, BOOTMODE[3:0] = 0100, FASTBOOT = 0), the bootloader code disables all C64x+ cache (L2, L1P, and L1D) so that upon exit from the bootloader code, all C64x+ memories are configured as all RAM (L2CFG.L2MODE = 0h, L1PCFG.L1PMODE = 0h, and L1DCFG.L1DMODE = 0h). If cache use is required, the application code must explicitly enable the cache. For more information on boot modes, see Section 3.4.1, *Boot Modes*. For more information on the bootloader, see the *Using the TMS320DM643x Bootloader* Application Report (literature number SPRAAG0).

b. Peripherals configuration: see the respective peripheral user's guide.

Special considerations: DDR2 memory controller—the Peripheral Bus Burst Priority Register (PBBPR) should be programmed to ensure good DDR2 throughput and to prevent command starvation (prevention of certain commands from being processed by the DDR2 memory controller). For more details, see the *TMS320DM643x DMP DDR2 Memory Controller* User's Guide (literature number SPRU986). A hex value of 0x20 is recommended for the PBBPR PR_OLD_COUNT field to provide a good DSP performance and still allow good utilization by other modules.

3.9 Debugging Considerations

3.9.1 Pullup/Pulldown Resistors

Proper board design should ensure that input pins to the DM643x DMP device always be at a valid logic level and not floating. This may be achieved via pullup/pulldown resistors. The DM643x DMP features internal pullup (IPU) and internal pulldown (IPD) resistors on most pins to eliminate the need, unless otherwise noted, for *external* pullup/pulldown resistors.

An external pullup/pulldown resistor needs to be used in the following situations:

- *Boot and Configuration Pins*: If the pin is both routed out and 3-stated (not driven), an external pullup/pulldown resistor is ***strongly recommended***, even if the IPU/IPD matches the desired value/state.
- *Other Input Pins*: If the IPU/IPD *does not* match the desired value/state, use an external pullup/pulldown resistor to pull the signal to the opposite rail.
- *EMIFA Chip Select Outputs*: On DM6433, the EMIFA chip select pins ($\overline{\text{EM\_CS2}}$, $\overline{\text{EM\_CS3}}$, $\overline{\text{EM\_CS4}}$, and $\overline{\text{EM\_CS5}}$) feature an internal pulldown (IPD) resistor. If these pins are connected and used as an EMIFA chip select signal, for proper device operation, an external pullup resistor ***must*** be used to ensure the $\overline{\text{EM\_CSx}}$ function defaults to an inactive (high) state.

For the boot and configuration pins (listed in Table 2-5, *Boot Terminal Functions*), if they are both routed out and 3-stated (not driven), it is ***strongly recommended*** that an external pullup/pulldown resistor be implemented. Although, internal pullup/pulldown resistors exist on these pins and they may match the desired configuration value, providing external connectivity can help ensure that valid logic levels are latched on these device boot and configuration pins. In addition, applying external pullup/pulldown resistors on the boot and configuration pins adds convenience to the user in debugging and flexibility in switching operating modes.

Tips for choosing an external pullup/pulldown resistor:

- Consider the total amount of current that may pass through the pullup or pulldown resistor. Make sure to include the leakage currents of all the devices connected to the net, as well as any internal pullup or pulldown resistors.
- Decide a target value for the net. For a pulldown resistor, this should be below the lowest V_{IL} level of all inputs connected to the net. For a pullup resistor, this should be above the highest V_{IH} level of all inputs on the net. A reasonable choice would be to target the V_{OL} or V_{OH} levels for the logic family of the limiting device; which, by definition, have margin to the V_{IL} and V_{IH} levels.
- Select a pullup/pulldown resistor with the largest possible value; but, which can still ensure that the net will reach the target pulled value when maximum current from all devices on the net is flowing through the resistor. The current to be considered includes leakage current plus, any other internal and external pullup/pulldown resistors on the net.
- For bidirectional nets, there is an additional consideration which sets a lower limit on the resistance value of the external resistor. Verify that the resistance is small enough that the weakest output buffer can drive the net to the opposite logic level (including margin).
- Remember to include tolerances when selecting the resistor value.
- For pullup resistors, also remember to include tolerances on the DV_{DD} rail.

For most systems, a 1-kΩ resistor can be used to oppose the IPU/IPD while meeting the above criteria. Users should confirm this resistor value is correct for their specific application.

For most systems, a 20-kΩ resistor can be used to compliment the IPU/IPD on the boot and configuration pins while meeting the above criteria. Users should confirm this resistor value is correct for their specific application.

For more detailed information on input current (I_I), and the low-/high-level input voltages (V_{IL} and V_{IH}) for the DM643x DMP, see Section 5.3, *Electrical Characteristics Over Recommended Ranges of Supply Voltage and Operating Temperature*.

For the internal pullup/pulldown resistors for all device pins, see the peripheral/system-specific terminal functions table.

4 System Interconnect

On the DM6433 device, the C64x+ Megamodule, the EDMA3 transfer controllers, and the system peripherals are interconnected through a switch fabric architecture (see Figure 4-1). The switch fabric is composed of multiple switched central resources (SCRs) and multiple bridges. The SCRs establish low-latency connectivity between master peripherals and slave peripherals. Additionally, the SCRs provide priority-based arbitration and facilitate concurrent data movement between master and slave peripherals. Through an SCR, the DSP subsystem can send data to the DDR2 Memory Controller without affecting a data transfer between the EMAC and L2 memory. Bridges are mainly used to perform bus-width conversion as well as bus operating frequency conversion. For example, in Figure 4-1, Bridge 6 performs a frequency conversion between a bus operating at DSP/3 clock rate and a bus operating at DSP/6 clock rate. Furthermore, Bridge 5 performs a bus-width conversion between a 64-bit bus and a 32-bit bus.

The C64x+ Megamodule, the EDMA3 transfer controllers (EDMA3TC[2:0]), and the various system peripherals can be classified into two categories: master peripherals and slave peripherals. Master peripherals are typically capable of initiating read and write transfers in the system and ***do not*** rely on the EDMA3 or on the CPU to perform transfers to and from them. The system master peripherals include the C64x+ Megamodule, the EDMA3 transfer controllers, VLYNQ, EMAC, HPI, PCI, and VPSS. Not all master peripherals may connect to all slave peripherals. The supported connections are designated by "Y" in Table 4-1.

Table 4-1. System Connection Matrix

MASTER PERIPHERALS/MODULES	SLAVE PERIPHERALS/MODULES				
	C64x+ SDMA	DDR2 MEMORY CONTROLLER	PCI (MASTER BACK-END I/F)	SCR4(1)	SCR2, SCR6, SCR7, SCR8(1)
C64x+ MDMA	–	Y	Y	–	Y
VPSS	–	Y	–	–	–
PCI (SLAVE BACK-END I/F)	Y	Y	–	Y	Y
VLYNQ	Y	Y	–	Y	Y
EMAC	Y	Y	–	Y	Y
HPI	Y	Y	–	Y	Y
EDMA3TC's (EDMA3TC2/TC1/TC0)	Y	Y	Y	Y	Y
C64x+ CFG	–	–	–	Y	Y

(1) All the peripherals/modules that support a connection to SCR2, SCR4, SCR6, SCR7, and SCR8 have access to all peripherals/modules connected to those respective SCRs.

4.1 System Interconnect Block Diagram

Figure 4-1 displays the DM6433 system interconnect block diagram. The following is a list that helps in the interpretation of this diagram:

- The direction of the arrows indicates either a bus master *or* bus slave.
- The arrow originates at a bus master and terminates at a bus slave.
- The direction of the arrows ***does not*** indicate the direction of data flow. Data flow is typically bi-directional for each of the documented bus paths.
- The pattern of each arrow's line indicates the clock rate at which it is operating— i.e., either DSP/3, DSP/6, or MXI/CLKIN clock rate.
- A peripheral may have multiple instances shown in Figure 4-1 for the following reason:
  - The peripheral/module has master port(s) for data transfers, as well as slave port(s) for register access, data access, and/or memory access. Examples of these peripherals are C64X+ Megamodule, EDMA3, VPSS, VLYNQ, HPI, EMAC, and PCI.

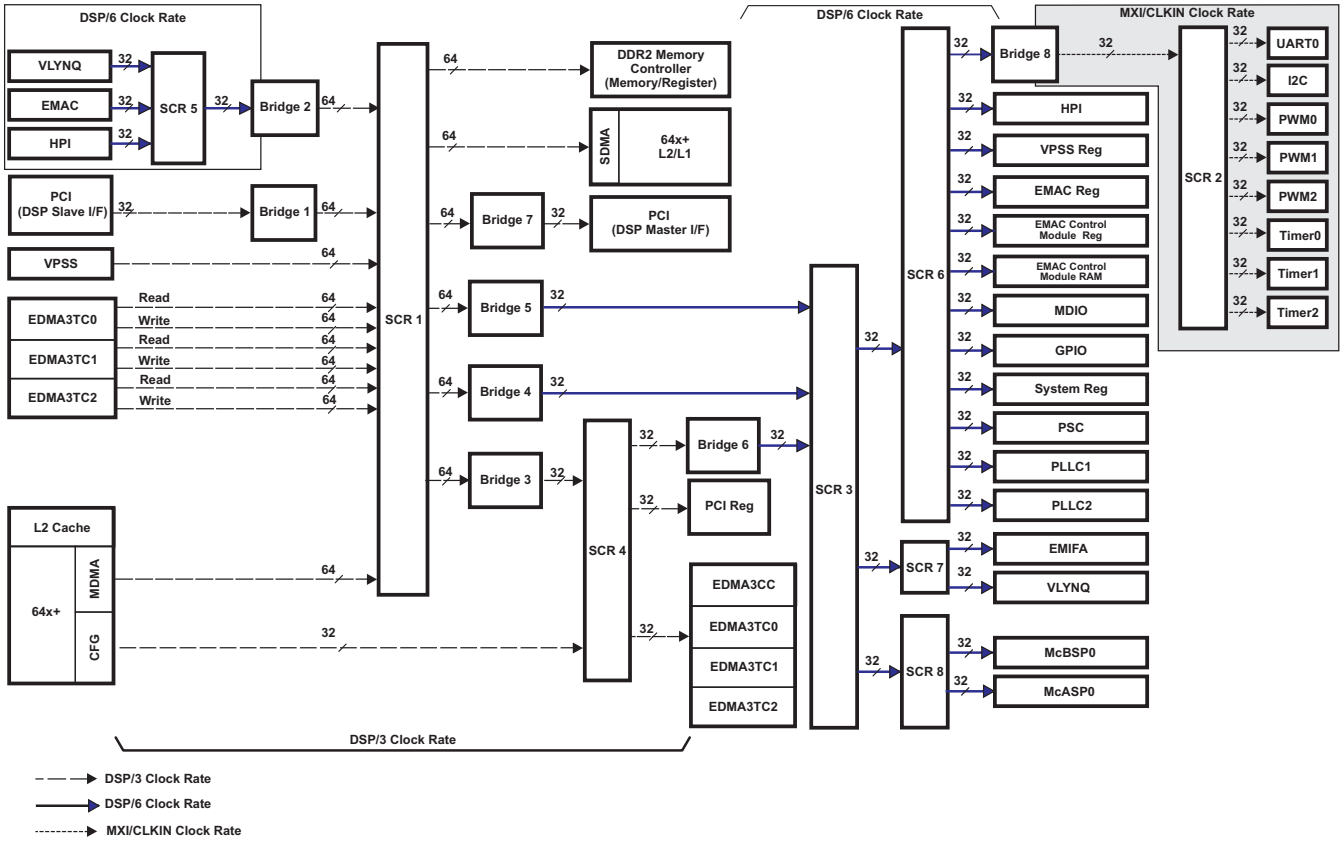

Figure 4-1. System Interconnect Block Diagram

5 Device Operating Conditions

5.1 Absolute Maximum Ratings Over Operating Temperature Range (Unless Otherwise Noted)(1)

Supply voltage ranges:	Core (CV_{DD}, V_{DDA_1P1V}(2))(3)	–0.5 V to 1.5 V
	I/O, 3.3V (DV_{DD33})(3)	–0.5 V to 4.2 V
	I/O, 1.8V (DV_{DDR2}, DDR_VDDDLL, PLL_{PWR18}, V_{DDA_1P8V}, MXV_{DD})(3)	–0.5 to 2.5 V
Input voltage ranges:	V_I I/O, 3.3-V pins (except PCI-capable pins)	–0.5 V to 4.2 V
	V_I I/O, 3.3-V pins PCI-capable pins	–0.5 V to DV_{DD33} + 0.5 V
	V_I I/O, 1.8 V	–0.5 V to 2.5 V
Output voltage ranges:	V_O I/O, 3.3-V pins (except PCI-capable pins)	–0.5 V to 4.2 V
	V_O I/O, 3.3-V pins PCI-capable pins	–0.5 V to DV_{DD33} + 0.5 V
	V_O I/O, 1.8 V	–0.5 V to 2.5 V
Operating Junction temperature ranges, T_J:	Commercial	0°C to 90°C
	Automotive (Q or S suffix)	–40°C to 125°C
Storage temperature range, T_{stg}	(default)	–65°C to 150°C

(1) Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) Based on JESD22-C101C (*Field-Induced Charged-Device Model Test Method for Electrostatic-Discharge-Withstand Thresholds of Microelectronic Components*) testing the TMS320DM643xZDU device's charged-device model (CDM) sensitivity classification is Class II (200 to <500 V) when subjected to the required 3 discharges. When subjected to one discharge (+ and -), the classification is Class III which is the standard Texas Instruments' CDM design goal. All pins except the VDDA_1P1V (T20) pin associated with the DAC module demonstrate Class III performance.
(3) All voltage values are with respect to V_{SS}.

5.2 Recommended Operating Conditions(1)

			MIN	NOM	MAX	UNIT
CV_{DD}	Supply voltage, Core (CV_{DD}, V_{DDA_1P1V}) (2)	(-7/-6/-5/-4/-L/-Q6/-Q5/-Q4 devices)	1.14	1.2	1.26	V
		(-7/-6/-5/-4/-L/-Q5 devices)	1.0	1.05	1.1	V
DV_{DD}	Supply voltage, I/O, 3.3V (DV_{DD33})		2.97	3.3	3.63	V
	Supply voltage, I/O, 1.8V (DV_{DDR2}, DDR_VDDDLL, PLL_{PWR18}, V_{DDA_1P8V}, MXV_{DD} (3))		1.71	1.8	1.89	V
V_{SS}	Supply ground (V_{SS}, V_{SSA_1P8V}, V_{SSA_1P1V}, DDR_VSSDLL, MXV_{SS} (4))		0	0	0	V
DDR_VREF	DDR2 reference voltage(5)		$0.49DV_{DDR2}$	$0.5DV_{DDR2}$	$0.51DV_{DDR2}$	V
DDR_ZP	DDR2 impedance control, connected via 200 Ω resistor to V_{SS}			V_{SS}		V
DDR_ZN	DDR2 impedance control, connected via 200 Ω resistor to DV_{DDR2}			DV_{DDR2}		V
DAC_VREF	DAC reference voltage input		0.475	0.5	0.525	V
DAC_RBIAS	DAC biasing, connected via 4 kΩ resistor to V_{SSA_1P8V}			V_{SSA_1P8V}		V
V_{IH}	High-level input voltage, 3.3V (except PCI-capable and I2C pins)		2			V
	High-level input voltage, MXI/ CLKIN		$0.65MXV_{DD}$			V
	High-level input voltage, PCI		$0.5DV_{DD33}$		DV_{DD33} + 0.5	V
	High-level input voltage, I2C		$0.7DV_{DD33}$			V
V_{IL}	Low-level input voltage, 3.3V (except PCI-capable and I2C pins)				0.8	V
	Low-level input voltage, MXI/ CLKIN				$0.35MXV_{DD}$	V
	Low-level input voltage, PCI		–0.5		$0.3DV_{DD33}$	V
	Low-level input voltage, I2C		0		$0.3DV_{DD33}$	V
T_J	Operating Junction temperature(6)(7)	Commercial	0		90	°C
		Automotive (Q or S suffix)	–40		125	°C
T_A	Operating Ambient temperature(7)	Commercial	0		70	°C
		Automotive (Q or S suffix)	-40		85	°C
$F_{SYSCLK1}$ (2)	DSP Operating Frequency (SYSCLK1), CV_{DD} = 1.2 V	-7 devices			700	MHz
		-Q6 devices			660	MHz
		-6/ -L devices			600	MHz
		-5/-Q5 devices			500	MHz
		-4/-Q4 devices			400	MHz
	DSP Operating Frequency (SYSCLK1), CV_{DD} = 1.05 V	-7 devices			560	MHz
		-6/-L devices			450	MHz
		-5/-Q5 devices			400	MHz
		-4 devices			350	MHz

(1) The actual voltage *must* be determined at device power-up, and ***not*** be changed dynamically during run-time.
(2) Applies to "tape and reel" part number counterparts as well. For more information, see Section 2.8, *Device and Development-Support Tool Nomenclature*.
(3) Oscillator 1.8 V power supply (MXV_{DD}) can be connected to the same 1.8 V power supply as DV_{DDR2}.
(4) Oscillator ground (MXV_{SS}) must be kept separate from other grounds and connected directly to the crystal load capacitor ground.
(5) DDR_VREF is expected to equal $0.5DV_{DDR2}$ of the transmitting device and to track variations in the DV_{DDR2}.
(6) In the absence of a heat sink or direct thermal attachment on the top of the device, use the following formula to determine the device junction temperature: $T_J = T_C$ + (Power x Psi_{JT}). Power and T_C can be measured by the user. Section 7.1, *Thermal Data for ZWT* and Section 7.1.1, *Thermal Data for ZDU* provide the junction-to-package top (PSI_{JT}) value based on airflow in the system. In the presence of a heat sink or direct thermal attachment on the top of the device, additional calculations and considerations ***must*** be taken into account. For more detailed information on thermal considerations, measurements, and calculations, see the *Thermal Considerations for TMS320DM64xx, TMS320DM64x, and TMS320C6000 Devices* Application Report (literature number SPRAAL9).
(7) Applications must meet ***both*** the Operating Junction Temperature and Operating Ambient Temperature requirements. For more detailed information on thermal considerations, measurements, and calculations, see the *Thermal Considerations for TMS320DM64xx, TMS320DM64x, and TMS320C6000 Devices* Application Report (literature number SPRAAL9).

5.3 Electrical Characteristics Over Recommended Ranges of Supply Voltage and Operating Temperature (Unless Otherwise Noted)

PARAMETER		TEST CONDITIONS (1)	MIN	TYP	MAX	UNIT
V_{OH}	High-level output voltage (3.3V I/O except PCI-capable and I2C pins)	DV_{DD33} = MIN, I_{OH} = MAX	2.4			V
	High-level output voltage (3.3V I/O PCI-capable pins)	I_{OH} = -0.5 mA, DV_{DD33} = 3.3 V	$0.9DV_{DD33}$ (2)			V
V_{OL}	Low-level output voltage (3.3V I/O except PCI-capable and I2C pins)	DV_{DD33} = MIN, I_{OL} = MAX			0.4	V
	Low-level output voltage (3.3V I/O PCI-capable pins)	I_{OH} = 1.5 mA, DV_{DD33} = 3.3 V			$0.1DV_{DD33}$ (2)	V
	Low-level output voltage (3.3V I/O I2C pins)	I_O = 3 mA	0		0.4	V
I_I (3)	Input current [DC] (except I2C and PCI capable pins)	$V_I = V_{SS}$ to DV_{DD33} with internal pullup resistor (4)	50	100	250	µA
		$V_I = V_{SS}$ to DV_{DD33} with internal pulldown resistor (4)	–250	–100	–50	µA
	Input current [DC] (I2C)	$V_I = V_{SS}$ to DV_{DD33}			±10	µA
	Input current (PCI capable pins) [DC] (5)	$0 < V_I < DV_{DD33}$ = 3.3 V without internal resistor			±50	µA
		$0 < V_I < DV_{DD33}$ = 3.3 V with internal pullup resistor (4)	50		250	µA
		$0 < V_I < DV_{DD33}$ = 3.3 V with internal pulldown resistor (4)	–250		–50	µA
I_{OH}	High-level output current [DC]	CLK_OUT0/PWM2/GPIO[84] and VLYNQ_CLOCK/PCICLK/GP[57]			-8	mA
		DDR2			–13.4	mA
		PCI-capable pins			–0.5 (2)	mA
		All other peripherals			-4	mA
I_{OL}	Low-level output current [DC]	CLK_OUT0/PWM2/GPIO[84] and VLYNQ_CLOCK/PCICLK/GP[57]			8	mA
		DDR2			13.4	mA
		PCI-capable pins			1.5 (2)	mA
		All other peripherals			4	mA
I_{OZ} (6)	I/O Off-state output current	$V_O = DV_{DD33}$ or V_{SS}; internal pull disabled			±50	µA
		$V_O = DV_{DD33}$ or V_{SS}; internal pull enabled		±100		µA
I_{CDD}	Core (CV_{DD}, V_{DDA_1P1V}) supply current (7)	CV_{DD} = 1.2 V, DSP clock = 700 MHz		597		mA
		CV_{DD} = 1.2 V, DSP clock = 660 MHz		560		mA
		CV_{DD} = 1.2 V, DSP clock = 600 MHz		524		mA
		CV_{DD} = 1.2 V, DSP clock = 500 MHz		460		mA
		CV_{DD} = 1.2 V, DSP clock = 400 MHz		392		mA
		CV_{DD} = 1.05 V, DSP clock = 560 MHz		442		mA
		CV_{DD} = 1.05 V, DSP clock = 450 MHz		372		mA
		CV_{DD} = 1.05 V, DSP clock = 400 MHz		341		mA

(1) For test conditions shown as MIN, MAX, or NOM, use the appropriate value specified in the recommended operating conditions table.
(2) These rated numbers are from the *PCI Local Bus Specification Revision 2.3*. The DC specifications and AC specifications are defined in Table 4-3 (DC Specifications for 3.3V Signaling) and Table 4-4 (AC Specifications for 3.3V Signaling), respectively.
(3) I_I applies to input-only pins and bi-directional pins. For input-only pins, I_I indicates the input leakage current. For bi-directional pins, I_I indicates the input leakage current and off-state (Hi-Z) output leakage current.
(4) Applies only to pins with an internal pullup (IPU) or pulldown (IPD) resistor.
(5) PCI input leakage currents include Hi-Z output leakage for all bidirectional buffers with 3-state outputs.
(6) I_{OZ} applies to output-only pins, indicating off-state (Hi-Z) output leakage current.
(7) Measured under the following conditions: 60% DSP CPU utilization doing typical activity (peripheral configurations, other housekeeping activities); DDR2 Memory Controller at 50% utilization (135 MHz), 50% writes, 32 bits, 50% bit switching; 2 MHz McBSP0 at 100% utilization and 50% switching; Timer0 at 100% utilization. At room temperature (25 C) for typical process ZWT devices. The actual current draw varies across manufacturing processes and is highly application-dependent. DM643x DMP devices are offered in two basic options: lower-power option and high-performance option. Low-power devices offer lower power consumption across temperature and voltage when compared with high-performance devices. However, high-performance devices offer higher operating speeds. For more details on core and I/O activity, high-performance and low-power device power consumption, as well as information relevant to board power supply design, see the *TMS320DM643x Power Consumption Summary* Application Report (literature number SPRAAO6).

Electrical Characteristics Over Recommended Ranges of Supply Voltage and Operating Temperature (Unless Otherwise Noted) *(continued)*

PARAMETER		TEST CONDITIONS [1]	MIN	TYP	MAX	UNIT
I_{DDD}	3.3V I/O (DV_{DD33}) supply current[7]	DV_{DD} = 3.3 V, CV_{DD} = 1.2 V, DSP clock = 700 MHz		13		mA
		DV_{DD} = 3.3 V, CV_{DD} = 1.2 V, DSP clock = 660 MHz		13		mA
		DV_{DD} = 3.3 V, CV_{DD} = 1.2 V, DSP clock = 600 MHz		13		mA
		DV_{DD} = 3.3 V, CV_{DD} = 1.2 V, DSP clock = 500 MHz		13		mA
		DV_{DD} = 3.3 V, CV_{DD} = 1.2 V, DSP clock = 400 MHz		13		mA
		DV_{DD} = 3.3 V, CV_{DD} = 1.05 V, DSP clock = 560 MHz		13		mA

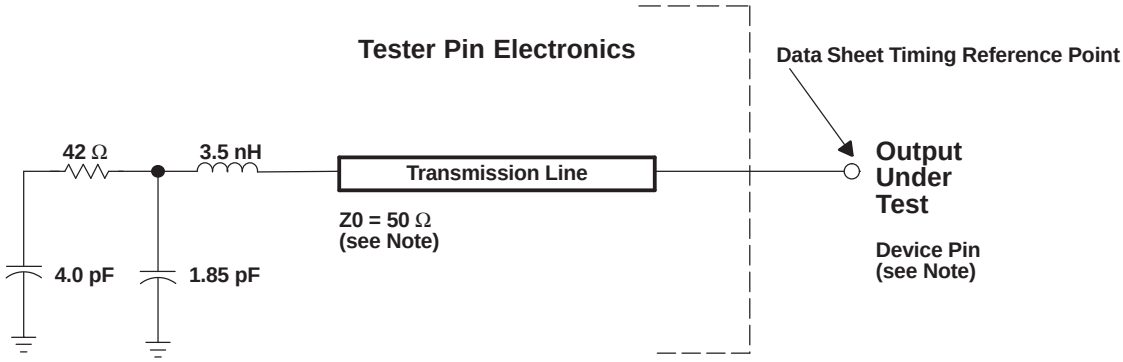
		DV_{DD} = 1.8 V, CV_{DD} = 1.05 V, DSP clock = 400 MHz		72		mA
C_I	Input capacitance				5	pF
C_o	Output capacitance				5	pF

6 Peripheral Information and Electrical Specifications

6.1 Parameter Information



NOTE: The data sheet provides timing at the device pin. For output timing analysis, the tester pin electronics and its transmission line effects must be taken into account. A transmission line with a delay of 2 ns can be used to produce the desired transmission line effect. The transmission line is intended as a load only. It is not necessary to add or subtract the transmission line delay (2 ns) from the data sheet timings.

Input requirements in this data sheet are tested with an input slew rate of < 4 Volts per nanosecond (4 V/ns) at the device pin.

Figure 6-1. Test Load Circuit for AC Timing Measurements

The load capacitance value stated is only for characterization and measurement of AC timing signals. This load capacitance value does not indicate the maximum load the device is capable of driving.

6.1.1 3.3-V Signal Transition Levels

All input and output timing parameters are referenced to V_{ref} for both "0" and "1" logic levels. For 3.3 V I/O, V_{ref} = 1.5 V. For 1.8 V I/O, V_{ref} = 0.9 V.

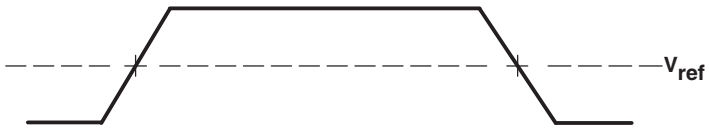


Figure 6-2. Input and Output Voltage Reference Levels for AC Timing Measurements

All rise and fall transition timing parameters are referenced to V_{IL} MAX and V_{IH} MIN for input clocks, V_{OL}MAX and V_{OH} MIN for output clocks.

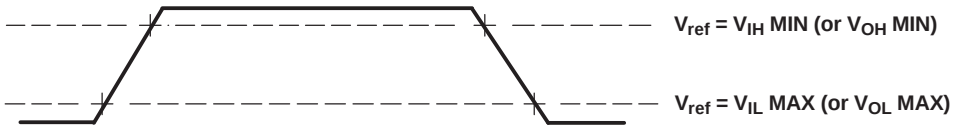

Figure 6-3. Rise and Fall Transition Time Voltage Reference Levels

6.1.2 3.3-V Signal Transition Rates

All timings are tested with an input edge rate of 4 volts per nanosecond (4 V/ns).

6.1.3 Timing Parameters and Board Routing Analysis

The timing parameter values specified in this data sheet do *not* include delays by board routings. As a good board design practice, such delays must *always* be taken into account. Timing values may be adjusted by increasing/decreasing such delays.

TI recommends utilizing the available I/O buffer information specification (IBIS) models to analyze the timing characteristics correctly. To properly use IBIS models to attain accurate timing analysis for a given system, see the *Using IBIS Models for Timing Analysis* application report (literature number SPRA839). If needed, external logic hardware such as buffers may be used to compensate any timing differences.

For the DDR2 memory controller interface, it is *not* necessary to use the IBIS models to analyze timing characteristics. TI provides a PCB routing rules solution that describes the routing rules to ensure the DDR2 memory controller interface timings are met. See the *Implementing DDR2 PCB Layout on the TMS320DM643x DMP DMSoC* Application Report (literature number SPRAAL6).

6.2 Recommended Clock and Control Signal Transition Behavior

All clocks and control signals ***must*** transition between V_{IH} and V_{IL} (or between V_{IL} and V_{IH}) in a monotonic manner.

6.3 Power Supplies

For more information regarding TI's power management products and suggested devices to power TI DSPs, visit www.ti.com/dsppower.

6.3.1 Power-Supply Sequencing

The DM6433 includes one core supply (CV_{DD}), and two I/O supplies—DV_{DD33} and DV_{DDR2}. To ensure proper device operation, a specific power-up sequence ***must*** be followed. Some TI power-supply devices include features that facilitate power sequencing—for example, Auto-Track and Slow-Start/Enable features. For more information on TI power supplies and their features, visit www.ti.com/dsppower.

Here is a summary of the power sequencing requirements:

- The power ramp order **must** be DV_{DD33} before DV_{DDR2}, and DV_{DDR2} before CV_{DD}—meaning during power up, the voltage at the DV_{DDR2} rail should never exceed the voltage at the DV_{DD33} rail. Similarly, the voltage at the CV_{DD} rail should never exceed the voltage at the DV_{DDR2} rail.
- From the time that power ramp begins, all power supplies (DV_{DD33}, DV_{DDR2}, CV_{DD}) **must** be stable within 200 ms. The term "stable" means reaching the recommended operating condition (see Section 5.2, *Recommended Operating Conditions* table).

6.3.2 Power-Supply Design Considerations

Core and I/O supply voltage regulators should be located close to the DSP to minimize inductance and resistance in the power delivery path. Additionally, when designing for high-performance applications utilizing the DM6433 device, the PC board should include separate power planes for core, I/O, and ground; all bypassed with high-quality low-ESL/ESR capacitors.

6.3.3 Power-Supply Decoupling

In order to properly decouple the supply planes from system noise, place as many capacitors (caps) as possible close to the DSP. These caps need to be close to the DSP, no more than 1.25 cm maximum distance to be effective. Physically smaller caps are better, such as 0402, but need to be evaluated from a yield/manufacturing point-of-view. Parasitic inductance limits the effectiveness of the decoupling capacitors, therefore physically smaller capacitors should be used while maintaining the largest available capacitance value.

Larger caps for each supply can be placed further away for bulk decoupling. Large bulk caps (on the order of 100 µF) should be furthest away, but still as close as possible. Large caps for each supply should be placed outside of the BGA footprint.

As with the selection of any component, verification of capacitor availability over the product's production lifetime should be considered.

For more details on capacitor usage and placement, see the *Implementing DDR2 PCB Layout on the TMS320DM643x DMP DMSoC* Application Report (literature number SPRAAL6).

6.3.4 DM6433 Power and Clock Domains

The DM6433 includes one single power domain — the "Always On" power domain. The "Always On" power domain is always on when the chip is on. The "Always On" domain is powered by the CV_{DD} pins of the DM6433. All DM6433 modules lie within the "Always On" power domain. Table 6-1 provides a listing of the DM6433 clock domains.

One primary reference clock is required for the DM6433 device. It can be either a crystal input or driven by external oscillators. A 27-MHz crystal is recommended for the PLLs, which generate the internal clocks for the digital media processor (DMP), peripherals, and EDMA3.

The DM6433 architecture is divided into the power and clock domains shown in Table 6-1. Table 6-2 and Table 6-3 further discuss the clock domains and their ratios. Figure 6-4 shows the Clock Domain block diagram.

Table 6-1. DM6433 Power and Clock Domains

Power Domain	Clock Domain	Peripheral/Module
Always On	CLKIN	UART0
Always On	CLKIN	I2C
Always On	CLKIN	Timer0
Always On	CLKIN	Timer1
Always On	CLKIN	Timer2
Always On	CLKIN	PWM0
Always On	CLKIN	PWM1
Always On	CLKIN	PWM2
Always On	CLKDIV3	DDR2
Always On	CLKDIV3	VPSS
Always On	CLKDIV3	EDMA
Always On	CLKDIV3	PCI
Always On	CLKDIV3	SCR
Always On	CLKDIV6	GPSC
Always On	CLKDIV6	LPSCs
Always On	CLKDIV6	PLLC1
Always On	CLKDIV6	PLLC2
Always On	CLKDIV6	Ice Pick
Always On	CLKDIV6	EMIFA
Always On	CLKDIV6	HPI
Always On	CLKDIV6	VLYNQ
Always On	CLKDIV6	EMAC
Always On	CLKDIV6	McASP0
Always On	CLKDIV6	McBSP0
Always On	CLKDIV6	GPIO
Always On	CLKDIV1	C64x+ CPU

Table 6-2. DM6433 Clock Domains

SUBSYSTEM	CLOCK DOMAIN	DOMAIN CLOCK SOURCE	FIXED RATIO vs. SYSCLK1 FREQUENCY	EXAMPLE FREQUENCY (MHz)
Peripherals (CLKIN Domain)	CLKIN	PLLC1 AUXCLK(1)	–	27 MHz
DSP Subsystem	CLKDIV1	PLLC1 SYSCLK1	1:1	594 MHz
EDMA3	CLKDIV3	PLLC1 SYSCLK2	1:3	198 MHz
VPSS	CLKDIV3	PLLC1 SYSCLK2	1:3	198 MHz
Peripherals (CLKDIV3 Domain)	CLKDIV3	PLLC1 SYSCLK2	1:3	198 MHz
Peripherals (CLKDIV6 Domain)	CLKDIV6	PLLC1 SYSCLK3	1:6	99 MHz

(1) PLLC1 AUXCLK runs at exactly the same frequency as the device clock source from the MXI/CLKIN pin.

The CLKDIV1:CLKDIV3:CLKDIV6 ratio must be strictly followed by programming the PLL Controller 1 (PLLC1) PLLDIV1, PLLDIV2, and PLLDIV3 registers appropriately (see Table 6-3).

Table 6-3. PLLC1 Programming for CLKDIV1, CLKDIV3, CLKDIV6 Domains

	CLKDIV1 DOMAIN (SYSCLK1)		CLKDIV3 DOMAIN (SYSCLK2)		CLKDIV6 DOMAIN (SYSCLK3)	
	PLL1 Divide-Down	PLLDIV1.RATIO	PLL1 Divide-Down	PLLDIV2.RATIO	PLL1 Divide-Down	PLLDIV3.RATIO
DIV1	/1	0	/3	2	/6	5
DIV2	/2	1	/6	5	/12	11
DIV3	/3	2	/9	8	/18	17

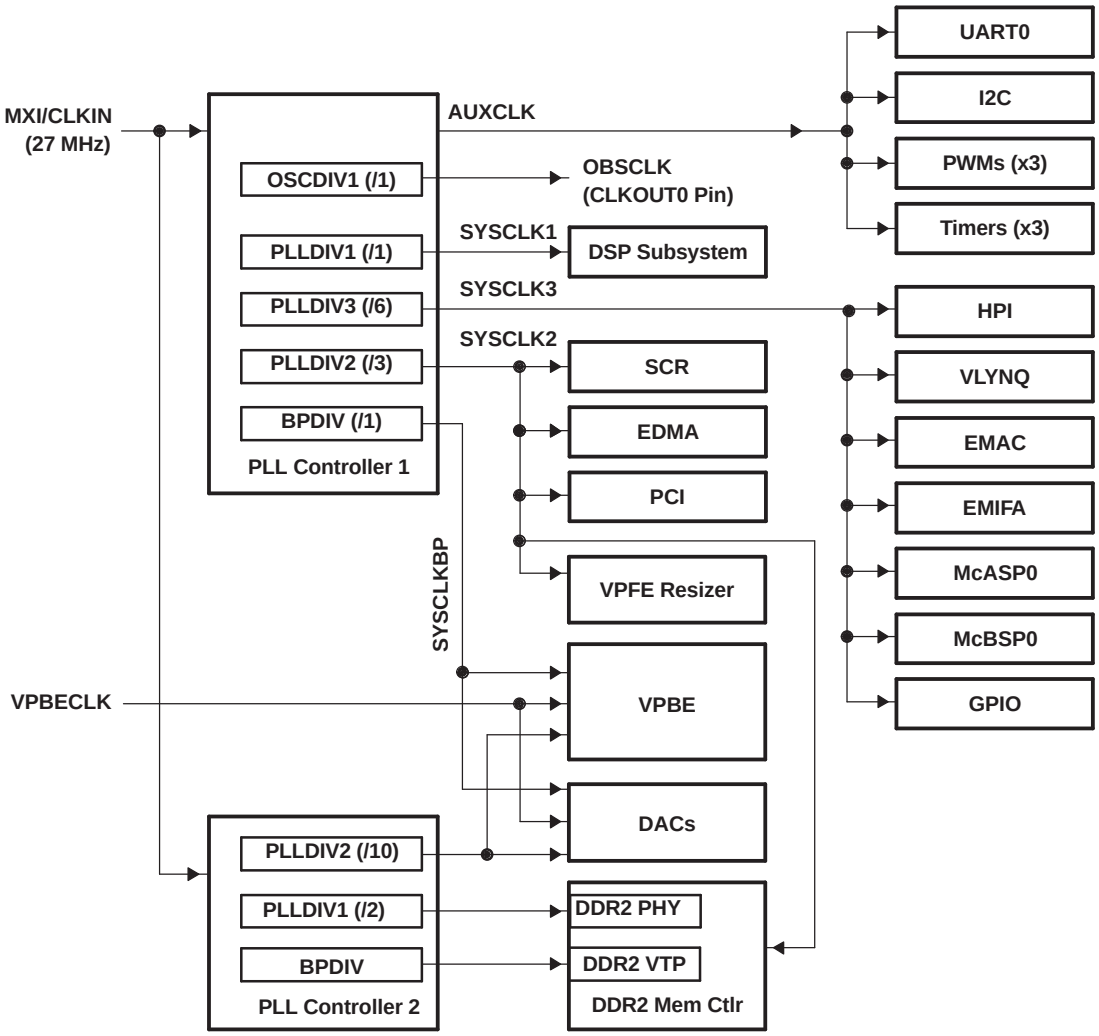

Figure 6-4. PLL1 and PLL2 Clock Domain Block Diagram

For further detail on PLL1 and PLL2, see the structure block diagrams Figure 6-5 and Figure 6-6, respectively.

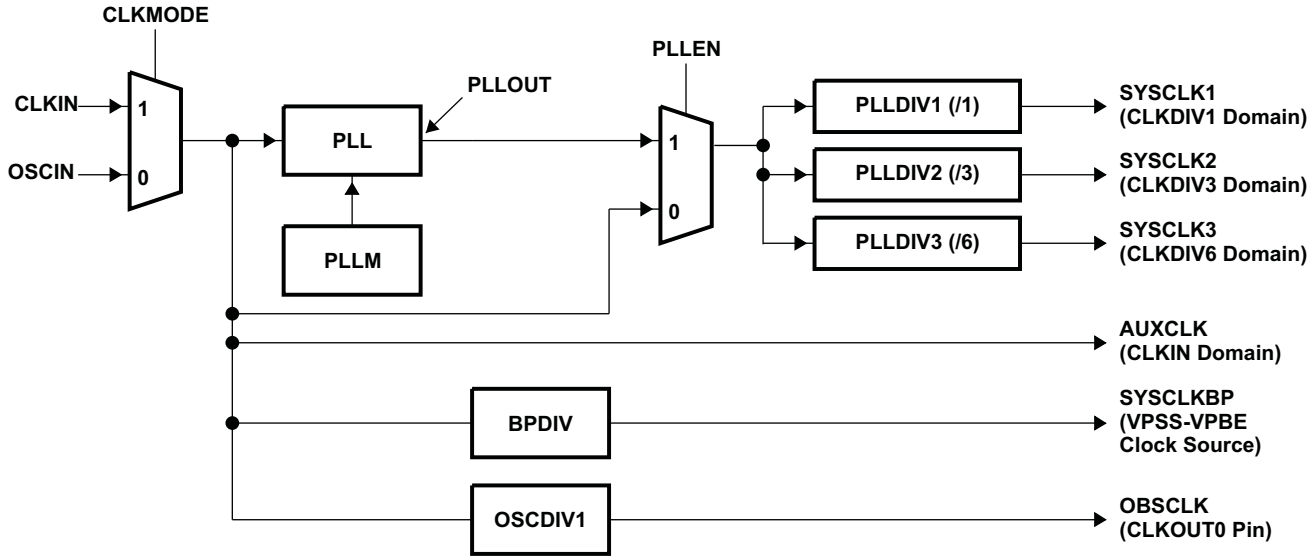

Figure 6-5. PLL1 Structure Block Diagram

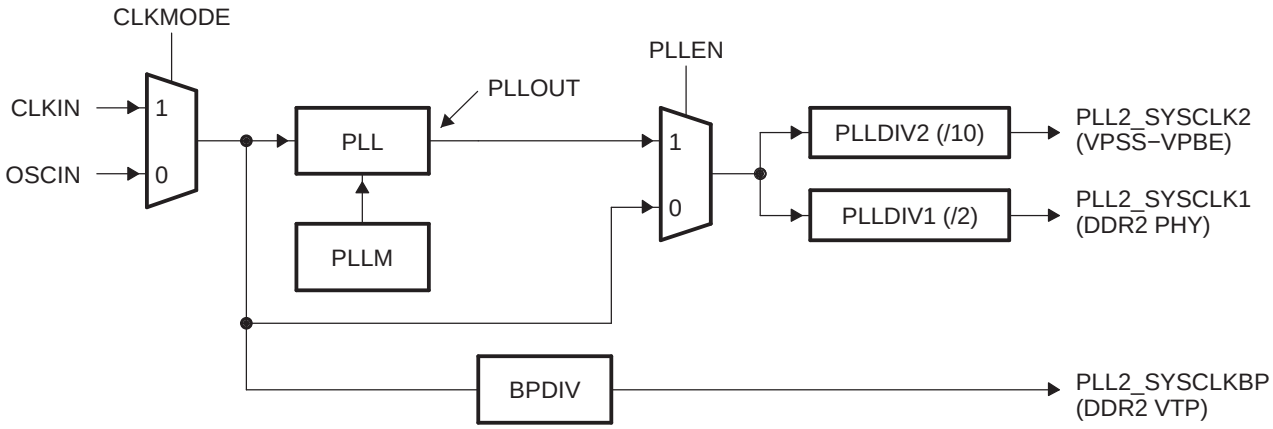

Figure 6-6. PLL2 Structure Block Diagram

6.3.5 Power and Sleep Controller (PSC)

The Power and Sleep Controller (PSC) controls power by turning off unused power domains or by gating off clocks to individual peripherals/modules. The DM6433 device only utilizes the clock gating feature of the PSC for power savings. The PSC consists of a Global PSC (GPSC) and a set of Local PSCs (LPSCs). The GPSC contains memory mapped registers, PSC interrupt control, and a state machine for each peripheral/module. An LPSC is associated with each peripheral/module and provides clock and reset control. The LPSCs for DM6433 are shown in Table 6-4. The PSC Register memory map is given in Table 6-5. For more details on the PSC, see the *TMS320DM643x DMP DSP Subsystem* Reference Guide (literature number SPRU978).

Table 6-4. DM6433 LPSC Assignments

LPSC Number	Peripheral/Module	LPSC Number	Peripheral/Module	LPSC Number	Peripheral/Module
0	VPSS DMA	14	EMIFA	28	TIMER1

6.4 Enhanced Direct Memory Access (EDMA3) Controller

The EDMA controller handles all data transfers between memories and the device slave peripherals on the DM6433 device. These data transfers include cache servicing, non-cacheable memory accesses, user-programmed data transfers, and host accesses. These are summarized as follows:

- Transfer to/from on-chip memories
  - DSP L1D memory
  - DSP L2 memory
- Transfer to/from external storage
  - DDR2 SDRAM
  - NAND flash
  - Asynchronous EMIF (EMIFA)
- Transfer to/from peripherals/hosts
  - VLYNQ
  - HPI
  - McBSP0
  - McASP0
  - PWM
  - UART0
  - PCI

The EDMA supports two addressing modes: constant addressing and increment addressing. On the DM6433, constant addressing mode is **not** supported by any peripheral or internal memory. For more information on these two addressing modes, see the *TMS320DM643x DMP Enhanced Direct Memory Access (EDMA3) Controller* User's Guide (literature number SPRU987).

6.4.1 EDMA3 Channel Synchronization Events

The EDMA supports up to 64 EDMA channels which service peripheral devices and external memory. Table 6-6 lists the source of EDMA synchronization events associated with each of the programmable EDMA channels. For the DM6433 device, the association of an event to a channel is fixed; each of the EDMA channels has one specific event associated with it. These specific events are captured in the EDMA event registers (ER, ERH) even if the events are disabled by the EDMA event enable registers (EER, EERH). For more detailed information on the EDMA module and how EDMA events are enabled, captured, processed, linked, chained, and cleared, etc., see the *TMS320DM643x DMP Enhanced Direct Memory Access (EDMA3) Controller* User's Guide (literature number SPRU987).

Table 6-6. DM6433 EDMA Channel Synchronization Events(1)

EDMA CHANNEL	EVENT NAME	EVENT DESCRIPTION
0-1	–	Reserved
2	XEVT0	McBSP0 Transmit Event
3	REVT0	McBSP0 Receive Event
4	–	Reserved
5	–	Reserved
6	–	Reserved
7	–	Reserved
8	–	Reserved
9	RSZEVT	VPSS Resizer Event
10	AXEVTE0	McASP0 Transmit Event Even

(1) In addition to the events shown in this table, each of the 64 channels can also be synchronized with the transfer completion or alternate transfer completion events. For more detailed information on EDMA event-transfer chaining, see the *Document Support* section for the Enhanced Direct Memory Access (EDMA) Controller Reference Guide.

Table 6-6. DM6433 EDMA Channel Synchronization Events (continued)

6.5 Reset

The reset controller detects the different type of resets supported on the DM6433 device and manages the distribution of those resets throughout the device.

The DM6433 device has several types of device-level global resets - power-on reset, warm reset, and max reset. Table 6-10 explains further the types of reset, the reset initiator, and the effects of each reset on the chip. See Section 6.5.9, *Reset Electrical Data/Timing*, for more information on the effects of each reset on the PLL controllers and their clocks.

Table 6-10. Device-Level Global Reset Types

TYPE	INITIATOR	EFFECT(s)
Power-on Reset (POR)	$\overline{\text{POR}}$ pin	Global chip reset (Cold reset). Activates the POR signal on chip, which resets the entire chip including the emulation logic. The power-on reset ($\overline{\text{POR}}$) pin ***must*** be driven low during power ramp of the device. Device boot and configuration pin are latched.
Warm Reset	$\overline{\text{RESET}}$ pin	Resets everything except for the emulation logic. Emulator stays alive during Warm Reset. Device boot and configuration pin are latched.
Max Reset	Emulator, WD Timer (Timer 2)	Same as a Warm Reset, except the DM6433 device boot and configuration pins are ***not*** re-latched.

In addition to device-level global resets, the PSC provides the capability to cause local resets to peripherals and/or the CPU.

6.5.1 Power-on Reset ($\overline{\text{POR}}$ Pin)

Power-on Reset (POR) is initiated by the $\overline{\text{POR}}$ pin and is used to reset the entire chip, including the emulation logic. Power-on Reset is also referred to as a cold reset since the device usually goes through a power-up cycle. During power-up, the $\overline{\text{POR}}$ pin must be asserted (driven low) until the power supplies have reached their normal operating conditions. If an external 27-MHz oscillator is used on the MXI/CLKIN pin, the source clock should also be running at the correct frequency prior to de-asserting the $\overline{\text{POR}}$ pin. **Note:** A device power-up cycle is not required to initiate a Power-on Reset.

The following sequence ***must*** be followed during a Power-on Reset.

1. Wait for the power supplies to reach normal operating conditions while keeping the $\overline{\text{POR}}$ pin asserted (driven low).
2. Wait for the input clock source to be stable while keeping the $\overline{\text{POR}}$ pin asserted (low).
3. Once the power supplies and the input clock source are stable, the $\overline{\text{POR}}$ pin ***must*** remain asserted (low) for a minimum of 12 MXI cycles.

   Within the low period of the $\overline{\text{POR}}$ pin, the following happens:
   - The reset signals flow to the entire chip (including the emulation logic), resetting the modules on chip.
   - The PLL Controller clocks start at the frequency of the MXI clock. The clocks are propagated throughout the chip to reset the chip synchronously. By default, both PLL1 and PLL2 are in reset and unlocked. The PLL Controllers default to PLL Bypass Mode.
   - The $\overline{\text{RESETOUT}}$ pin stays asserted (low), indicating the device is in reset.
4. The $\overline{\text{POR}}$ pin may now be deasserted (driven high).

   When the $\overline{\text{POR}}$ pin is deasserted (high), the configuration pin values are latched and the PLL Controllers changed their system clocks to their default divide-down values. Both PLL Controllers are still in PLL Bypass Mode. Other device initialization also begins.
5. After device initialization is complete, the PLL Controllers pause the system clocks for 10 cycles. At the end of these 10 cycles, the $\overline{\text{RESETOUT}}$ pin is deasserted (driven high).

   At this point:

– The I/O pins are controlled by the default peripherals (default peripherals are determined by PINMUX0 and PINMUX1 registers).
– The clock and reset of each peripheral is determined by the default settings of the Power and Sleep Controller (PSC).
– The PLL Controllers are operating in PLL Bypass Mode.
– The C64x+ begins executing from DSPBOOTADDR (determined by bootmode selection).

After the reset sequence, the boot sequence begins. For more details on the boot sequence, see the *Using the TMS320DM643x Bootloader* Application Report (literature number SPRAAG0).

After the boot sequence, follow the software initialization sequence described in Section 3.8, *Device Initialization Sequence After Reset*.

6.5.1.1 Usage of $\overline{\text{POR}}$ versus $\overline{\text{RESET}}$ Pins

$\overline{\text{POR}}$ and $\overline{\text{RESET}}$ are independent resets.

If the device needs to go through a power-up cycle, $\overline{\text{POR}}$ (*not* $\overline{\text{RESET}}$) ***must*** be used to fully reset the device.

In functional end-system, emulation/debugger logic is typically *not* needed; therefore, the recommendation for functional end-system is to use the $\overline{\text{POR}}$ pin for full device reset. If $\overline{\text{RESET}}$ pin is *not* needed, it can be pulled inactive (high) via an external pullup resistor.

In a debug system, it is typically desirable to allow the reset of the device without crashing an emulation session. In this case, the user can use the $\overline{\text{POR}}$ pin to achieve full device reset and use the $\overline{\text{RESET}}$ pin to achieve a debug reset—which resets the entire device except emulation logic.

6.5.1.2 Latching Boot and Configuration Pins

Internal to the chip, the two device reset pins $\overline{\text{RESET}}$ and $\overline{\text{POR}}$ are logically AND'd together *only* for the purpose of latching device boot and configuration pins. The values on all device and boot configuration pins are latched into the BOOTCFG register when the logical AND of $\overline{\text{RESET}}$ and $\overline{\text{POR}}$ transitions from low-to-high.

6.5.2 Warm Reset ($\overline{\text{RESET}}$ Pin)

A Warm Reset is activated by driving the $\overline{\text{RESET}}$ pin active low. This resets everything in the device except the emulation logic. An emulator session will stay alive during warm reset.

For more information on $\overline{\text{POR}}$ vs. $\overline{\text{RESET}}$ usage, see Section 6.5.1.1, *Usage of $\overline{\text{POR}}$ versus $\overline{\text{RESET}}$ Pins* and Section 6.5.1.2, *Latching Boot and Configuration Pins*.

The following sequence ***must*** be followed during a Warm Reset:

1. Power supplies and input clock source should already be stable.
2. The RESET pin ***must*** be asserted (low) for a minimum of 12 MXI cycles.

   Within the low period of the $\overline{\text{RESET}}$ pin, the following happens:
   – The reset signals flow to the entire chip resetting all the modules on chip, except the emulation logic.
   – The PLL Controllers are reset thereby, switching back to PLL Bypass Mode and resetting all their registers to default values. Both PLL1 and PLL2 are placed in reset and lose lock.
   – The $\overline{\text{RESETOUT}}$ pin becomes asserted (low), indicating the device is in reset.
3. The $\overline{\text{RESET}}$ pin may now be deasserted (driven high).

   When the $\overline{\text{RESET}}$ pin is deasserted (high), the configuration pin values are latched and the PLL Controllers changed their system clocks to their default divide-down values. Both PLL Controllers are still in PLL Bypass Mode. Other device initialization also begins.
4. After device initialization is complete, the PLL Controllers pause the system clocks for 10 cycles. At the end of these 10 cycles, the $\overline{\text{RESETOUT}}$ pin is deasserted (driven high).

At this point:
- The I/O pins are controlled by the default peripherals (default peripherals are determined by PINMUX0 and PINMUX1 registers).
- The clock and reset of each peripheral is determined by the default settings of the Power and Sleep Controller (PSC).
- The PLL Controllers are operating in PLL Bypass Mode.
- The C64x+ begins executing from DSPBOOTADDR (determined by bootmode selection).

After the reset sequence, the boot sequence begins. For more details on the boot sequence, see the *Using the TMS320DM643x Bootloader* Application Report (literature number SPRAAG0)).

After the boot sequence, follow the software initialization sequence described in Section 3.8, *Device Initialization Sequence After Reset*.

6.5.3 Maximum Reset

A Maximum (Max) Reset is initiated by the emulator or the watchdog timer (Timer 2). The effects are the same as a warm reset, except the device boot and configuration pins are not re-latched. The emulator initiates a maximum reset via the ICEPICK module. This ICEPICK initiated reset is non-maskable. When the watchdog timer counter reaches zero, this will also initiate a maximum reset to recover from a runaway condition. The watchdog timeout reset condition is masked if the TIMERCTL.WDRST bit is cleared to "0".

To invoke the maximum reset via the ICEPICK module, the user can perform the following from the Code Composer Studio™ IDE menu: Debug→Advanced Resets→System Reset

This is the Max Reset sequence:

1. Max Reset is initiated by the emulator or the watchdog timer.

   During this time, the following happens:
   - The reset signals flow to the entire chip resetting all the modules on chip except the emulation logic.
   - The PLL Controllers are reset thereby, switching back to PLL Bypass Mode and resetting all their registers to default values. Both PLL1 and PLL2 are placed in reset and lose lock.
   - The $\overline{\text{RESETOUT}}$ pin becomes asserted (low), indicating the device is in reset.
2. After device initialization is complete, the PLL Controllers pause the system clocks for 10 cycles. At the end of these 10 cycles, the $\overline{\text{RESETOUT}}$ pin is deasserted (driven high).

   At this point:
   - The I/O pins are controlled by the default peripherals (default peripherals are determined by PINMUX0 and PINMUX1 registers).
   - The clock and reset of each peripheral is determined by the default settings of the Power and Sleep Controller (PSC).
   - The PLL Controllers are operating in PLL Bypass Mode.
   - The C64x+ begins executing from DSPBOOTADDR (determined by bootmode selection).

After the reset sequence, the boot sequence begins. Since the boot and configuration pins are *not* latched with a Max Reset, the previous values (as shown in the BOOTCFG register) are used to select the boot mode. For more details on the boot sequence, see the *Using the TMS320DM643x Bootloader* Application Report (literature number SPRAAG0).

After the boot sequence, follow the software initialization sequence described in Section 3.8, *Device Initialization Sequence After Reset*.

6.5.4 CPU Local Reset

The C64x+ DSP CPU has an internal reset input that allows a host (PCI/HPI) to control it. This reset is configured through a register bit (MDCTL[39].LRST) in the Power Sleep Controller (PSC) module. When in C64x+ local reset, the slave DMA port on C64x+ will remain active and the internal memory will be accessible. For procedures on asserting and de-asserting CPU local reset by the host, see the *TMS320DM643x DMP DSP Subsystem* Reference Guide (literature number SPRU978).

For information on peripheral selection at the rising edge of $\overline{\text{POR}}$ or $\overline{\text{RESET}}$, see Section 3, *Device Configurations* of this data manual.

6.5.5 Peripheral Local Reset

The user can configure the local reset and clock state of a peripheral through programming the PSC. Table 6-4, DM6433 LPSC Assignments identifies the LPSC numbers and the peripherals capable of being locally reset by the PSC. For more detailed information on the programming of these peripherals by the PSC, see the *TMS320DM643x DMP DSP Subsystem* Reference Guide (literature number SPRU978).

6.5.6 Reset Priority

If any of the above reset sources occur simultaneously, the PLLC only processes the highest priority reset request. The reset request priorities are as follows (high to low):

- Power-on Reset
- Maximum Reset
- Warm Reset
- CPU Reset

6.5.7 Reset Controller Register

The Reset Type Status (RSTYPE) register (01C4 00E4) is the only register for the reset controller. This register falls in the same memory range as the PLL1 controller registers (see Table 6-18 for the PLL1 Controller Registers (including Reset Controller)). For more details on the RSTYPE register, see the *TMS320DM643x DMP DSP Subsystem* Reference Guide (literature number SPRU978).

6.5.8 Pin Behaviors at Reset

During normal operations, pins are controlled by the respective peripheral selected in the PINMUX0 or PINMUX1 register. During device level global reset, the pin behaves as follows:

Multiplexed Boot and Configuration Pins

These pins are forced 3-stated when $\overline{\text{RESETOUT}}$ is asserted (low). This is to ensure the proper boot and configuration values can be latched on these multiplexed pins. This is particularly useful in the case where the boot and configuration values are driven by an external control device. After $\overline{\text{RESETOUT}}$ is deasserted (high), these pins are controlled by their respective default peripheral.

- **Boot and Configuration Pins Group:** YOUT6/GP[28], YOUT5/GP[27], YOUT4/GP[26]/(FASTBOOT), YOUT3/GP[25]/(BOOTMODE3), YOUT2/GP[24]/(BOOTMODE2), YOUT1/GP[23]/(BOOTMODE1), YOUT0/GP[22]/(BOOTMODE0), R0/EM_A[4]/GP[10]/(AEAW2/PLLMS2), G1/EM_A[1]/(ALE)/GP[9]/(AEAW1/PLLMS1), B1/EM_A[2]/(CLE)/GP[8]/(AEAW0/PLLMS0), R1/EM_A[0]/GP[7]/(AEM2), R2/EM_BA[0]/GP[6]/(AEM1), and B2/EM_BA[1]/GP[5]/(AEM0).

For information on whether external pullup/pulldown resistors should be used on the boot and configuration pins, see Section 3.9.1, *Pullup/Pulldown Resistors*.

Default Power Down Pins

As discussed in Section 3.2, *Power Considerations*, the VDD3P3V_PWDN register controls power to the 3.3-V pins. The VDD3P3V_PWDN register defaults to powering down some 3.3-V pins to save power. For more details on the VDD3P3V_PWDN register and which 3.3-V pins default to powerup or powerdown, Section 3.2, *Power Considerations*. The pins that default to powerdown, are both reset to powerdown and high-impedance. They remain in that state until configured otherwise by VDD3P3_PWDN and PINMUX0/PINMUX1 programming.

- **Default Power Down Pin Group:** GP[4]/PWM1, ACLKR0/CLKX0/GP[99], AFSR0/DR0/GP[100], AHCLKR0/CLKR0/GP[101], AXR0[3]/FSR0/GP[102], AXR0[2]/FSX0/GP[103], AXR0[1]/DX0/GP[104], AXR0/GP[105], ACLKX0/GP[106], AFSX0/GP[107], AHCLKX0/GP[108], AMUTEIN0/GP[109], AMUTE0/GP[110], TOUT1L/GP[55], TINP1L/GP[56], CLKS0/TOUT0L/GP[97], TINP0L/GP[98], URXD0/GP[85], UTXD0/GP[86], UCTS0/GP[87], and URTS0/PWM0/GP[88].

All Other Pins

During RESETOUT assertion (low), all other pins are controlled by the default peripheral. The default peripheral is determined by the default settings of the PINMUX0 or PINMUX1 registers.

Some of the PINMUX0/PINMUX1 settings are determined by configuration pins latched at reset. To determine the reset behavior of these pins, see Section 3.7, *Multiplexed Pin Configurations* and read the rest of the this subsection to understand how that default peripheral controls the pin.

The reset behaviors for all these other pins are categorized as follows (also see Figure 6-7 and Figure 6-8 in Section 6.5.9, *Reset Electrical Data/Timing*):

- **Z+/Low Group (Z Longer-to-Low Group):** These pins are 3-stated when device-level global reset source (e.g., POR, RESET, or Max Reset) is asserted. These pins remain 3-stated throughout RESETOUT assertion. When RESETOUT is deasserted, these pins drive a logic low.
- **Z+/High Group (Z Longer-to-High Group):** These pins are 3-stated when device-level global reset source (e.g., POR, RESET, or Max Reset) is asserted. These pins remain 3-stated throughout RESETOUT assertion. When RESETOUT is deasserted, these pins drive a logic high.
- **Z+/Invalid Group (Z Longer-to-Invalid Group):** These pins are 3-stated when device-level global reset source (e.g., POR, RESET, or Max Reset) is asserted. These pins remain 3-stated throughout RESETOUT assertion. When RESETOUT is deasserted, these pins drive an invalid value until configured otherwise by their respective peripheral (after the peripheral is enabled by the PSC).
- **Z Group:** These pins are 3-stated by default, and these pins remain 3-stated throughout RESETOUT assertion. When RESETOUT is deasserted, these pins remain 3-stated until configured otherwise by their respective peripheral (after the peripheral is enabled by the PSC).
- **Low Group:** These pins are low by default, and remain low until configured otherwise by their respective peripheral (after the peripheral is enabled by the PSC).
- **High Group:** These pins are high by default, and remain high until configured otherwise by their respective peripheral (after the peripheral is enabled by the PSC).
- **Z/Low Group (Z-to-Low Group):** These pins are 3-stated when device-level global reset source (e.g., POR, RESET, or Max Reset) is asserted. When the reset source is deasserted, these pins drive a logic low.
- **Z/High Group (Z-to-High Group):** These pins are 3-stated when device-level global reset source (e.g., POR, RESET, or Max Reset) is asserted. When reset source is deasserted, these pins drive a logic high.
- **Clock Group:** These clock pins are toggling by default. They paused momentarily before RESETOUT is deasserted (high). The *only* pin in the Clock Group is CLKOUT0.

This is a list of possible default peripherals and how they control the pins during reset:

- **GPIO:** All GPIO pins behave according to Z Group.

  Note: The following EMIFA list *only* includes pins that can default to function as EMIFA signals.
- **EMIFA:** These EMIFA signals are multiplexed with boot and configuration pins: EM_A[4], EM_A[2:0],

EM_BA[0], EM_BA[1]; therefore, they are forced 3-stated throughout RESETOUT.
  - **Z+/Low Group:** EM_A[4], EM_A[2:0]
  - **Z+/High Group:** EM_BA[0], EM_BA[1], EM_OE, EM_WE
  - **Z+/Invalid Group:**EM_D[7:0]
  - **Z/Low Group:** EM_A[21:5], EM_A[3], EM_R/W
  - **Z/High Group:** EM_CS2
  - **Z Group:** EM_WAIT/(RDY/BSY)
- **DDR2 Memory Controller:**
  - **Clock Group:** DDR_CLK, DDR_CLK
  - **DDR2 Z Group:** DDR_DQM[3:0], DDR_DQS[3:0], DDR_D[31:0]
  - **DDR2 Low Group:** DDR_CKE, DDR_BA[2:0], DDR_A[12:0]
  - **DDR2 High Group:** DDR_CS, DDR_WE, DDR_RAS, DDR_CAS
- **PCI:** All PCI pins behave according to Z Group.
- **I2C:** All I2C pins behave according to Z Group.
- **JTAG:** TDO, EMU0, and EMU1 pins behave according to Z Group. TCK, TDI, TMS, and TRST are input-only pins.
- **Clock:** CLKOUT0

For more information on the pin behaviors during device-level global reset, see Figure 6-7 and Figure 6-8 in Section 6.5.9, *Reset Electrical Data/Timing*.

6.5.9 Reset Electrical Data/Timing

Note: If a configuration pin ***must*** be routed out from the device, the internal pullup/pulldown (IPU/IPD) resistor should ***not*** be relied upon; TI recommends the use of an external pullup/pulldown resistor.

Table 6-11. Timing Requirements for Reset (see Figure 6-7 and Figure 6-8)

NO.			-7/-6/-5/-4 -L/-Q6/-Q5/-Q4		UNIT
			MIN	MAX	
1	$t_{w(RESET)}$	Pulse duration, POR low or RESET low	12C(1)		ns
4	$t_{su(CONFIG)}$	Setup time, boot and configuration pins valid before POR high or RESET high(2)	12C(1)		ns
5	$t_{h(CONFIG)}$	Hold time, boot and configuration pins valid after POR high or RESET high(2)	0		ns

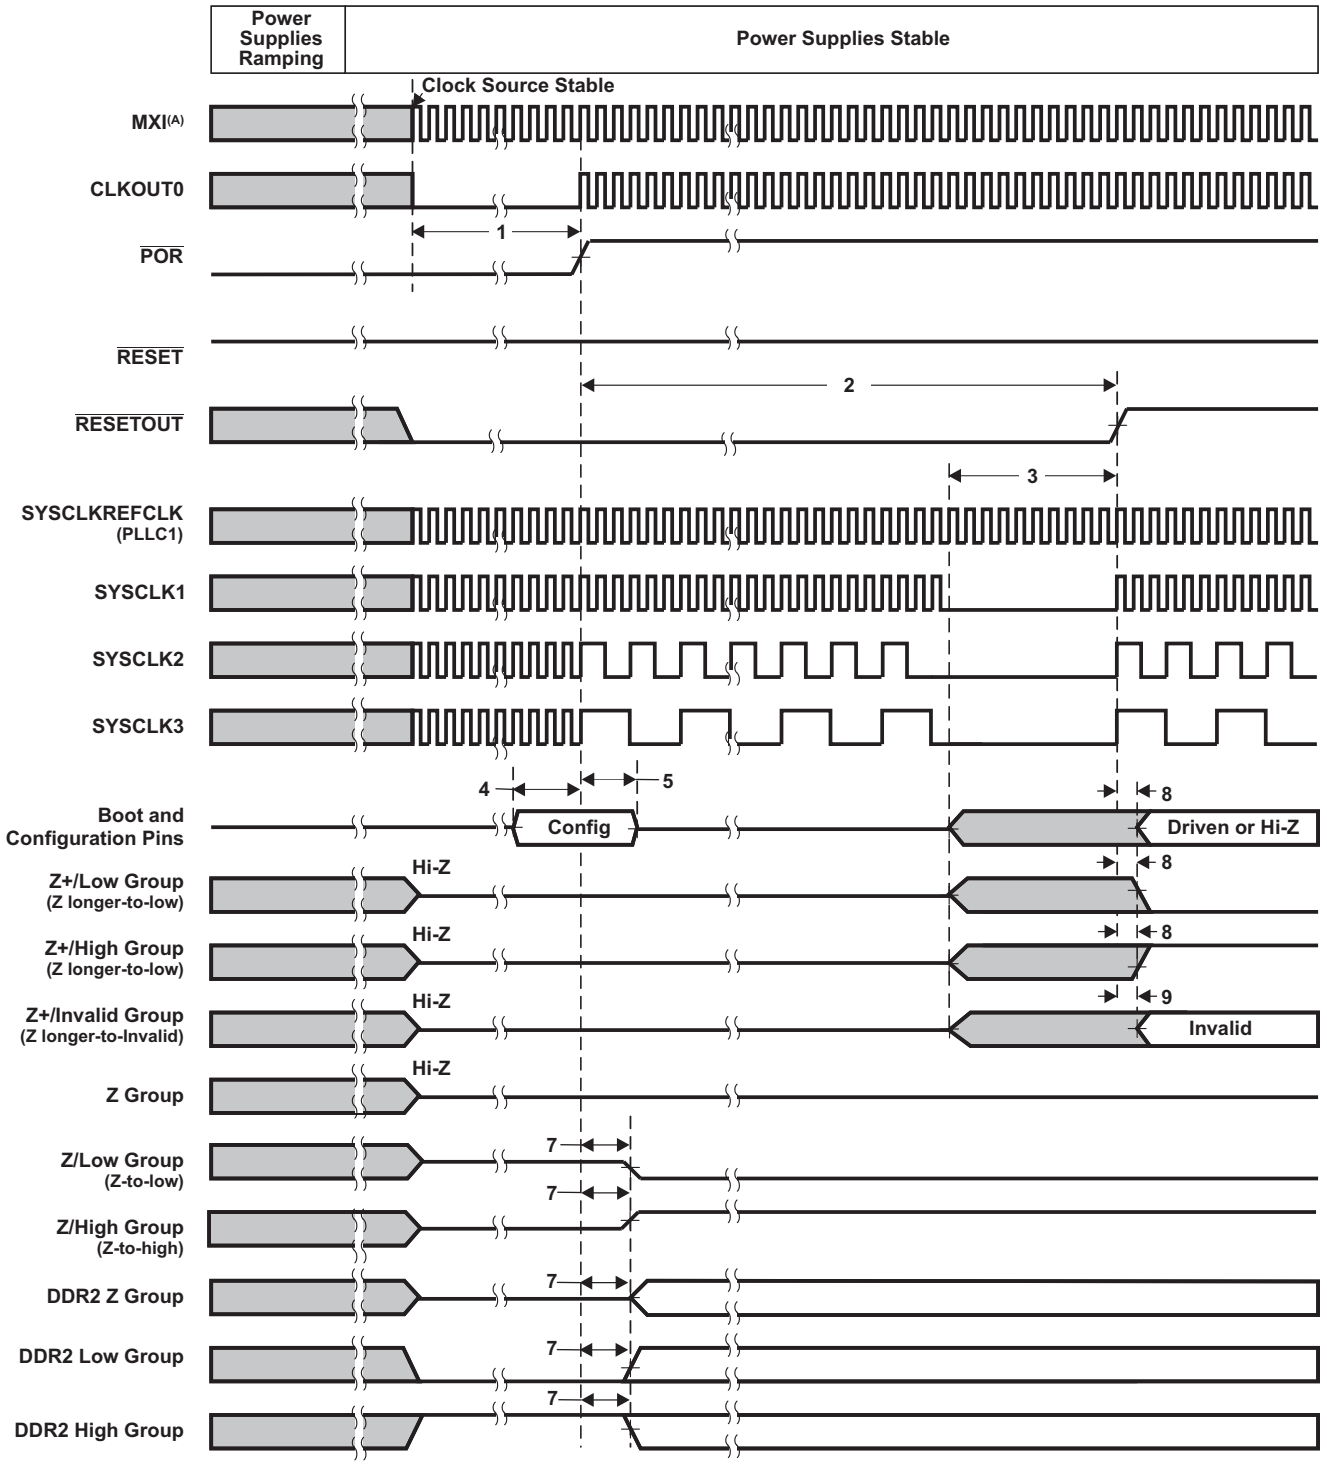
(1) C = 1/MXI clock frequency in ns. The device clock source ***must*** be stable and at a valid frequency prior to meeting the $t_{w(RESET)}$ requirement.
(2) For the list of boot and configuration pins, see Table 2-5, *Boot Terminal Functions*.

Table 6-12. Switching Characteristics Over Recommended Operating Conditions During Reset(1) (see Figure 6-8)

NO.	PARAMETER		-7/-6/-5/-4 -L/-Q6/-Q5/-Q4		UNIT
			MIN	MAX	
2	$t_{d(RSTH-RSTOUTH)}$	Delay time, POR high or RESET high to RESETOUT high		1900C	ns
3	$t_{w(PAUSE)}$	Pulse duration, SYSCLKs paused (low) before RESETOUT high	10C	10C	ns
6	$t_{d(RSTL-IV)}$	Delay time, POR low or RESET low to pins invalid		20	ns
7	$t_{d(RSTH-V)}$	Delay time, POR high or RESET high to pins valid		20	ns
8	$t_{d(RSTOUTH-V)}$	Delay time, RESETOUT high to pins valid		0	ns
9	$t_{d(RSTOUTH-IV)}$	Delay time, RESETOUT high to pins invalid		12C	ns

(1) C = 1/CLKIN1 clock frequency in ns.

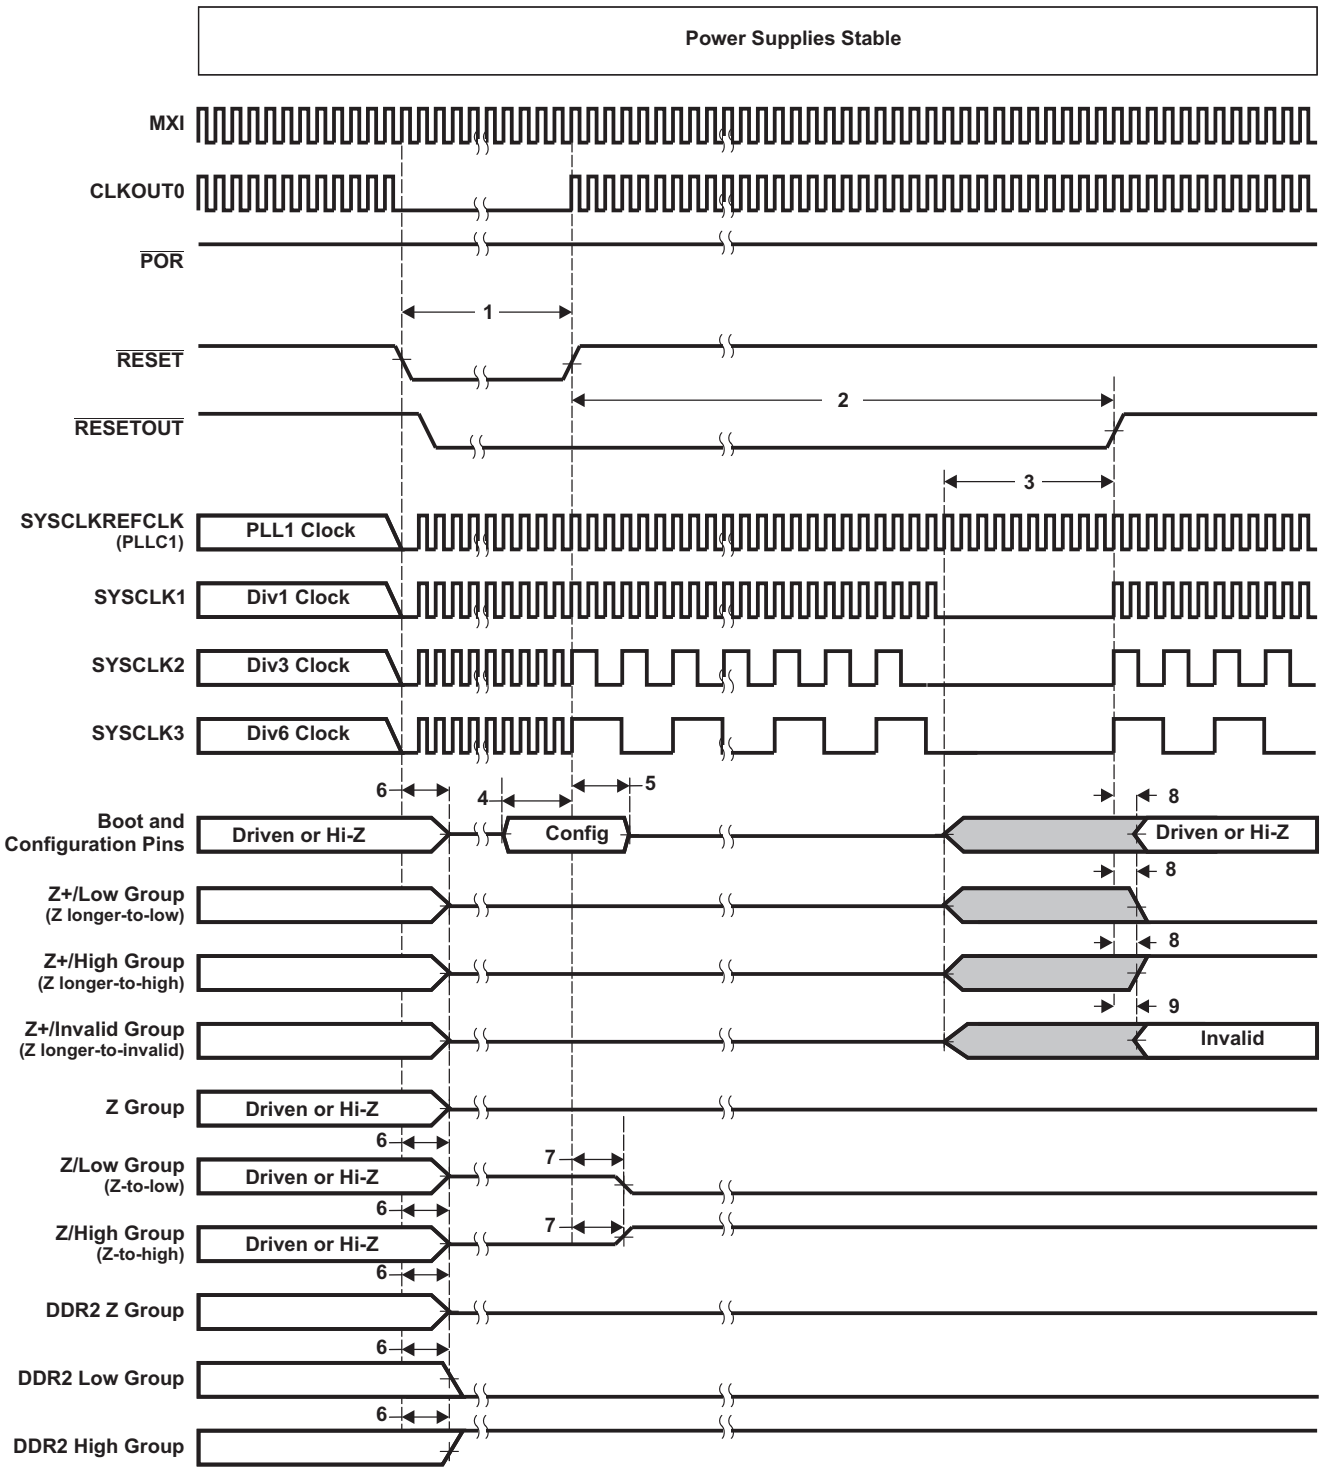
Figure 6-7 shows the Power-Up Timing. Figure 6-8 shows the Warm Reset ($\overline{\text{RESET}}$) Timing. Max Reset Timing is identical to Warm Reset Timing, except the boot and configuration pins are ***not*** relatched *and* the BOOTCFG register retains its previous value latched before the Max Reset was initiated.



A. Power supplies and MXI must be stable before the start of $t_{W(RESET)}$.

B. Pin reset behavior depends on which peripheral defaults to controlling the multiplexed pin. For more details on what pin group (e.g., Z Group, Z/Low Group, Z/High Group, etc.) each pin belongs to, see Section 6.5.8, *Pin Behaviors at Reset*.

Figure 6-7. Power-Up Timing(B)



A. Pin reset behavior depends on which peripheral defaults to controlling the multiplexed pin. For more details on what pin group (e.g., Z Group, Z/Low Group, Z/High Group, etc.) each pin belongs to, see Section 6.5.8, *Pin Behaviors at Reset*.

Figure 6-8. Warm Reset ($\overline{\text{RESET}}$) Timing[(A)]

6.6 External Clock Input From MXI/CLKIN Pin

The DM6433 device includes two options to provide an external clock input:

- Use an on-chip oscillator with external crystal.
- Use an external 1.8-V LVCMOS-compatible clock input.

The optimal external clock input frequency is 27 MHz. Section 6.6.1 provides more details on Option 1, using an on-chip oscillator with external crystal. Section 6.6.2 provides details on Option 2, using an external 1.8-V LVCMOS-compatible clock input.

6.6.1 Clock Input Option 1—Crystal

In this option, a crystal is used as the external clock input to the DM6433.

The 27-MHz oscillator provides the reference clock for all DM6433 subsystems and peripherals. The on-chip oscillator requires an external 27-MHz crystal connected across the MXI and MXO pins, along with two load capacitors, as shown in Figure 6-9. The external crystal load capacitors ***must*** be connected only to the 27-MHz oscillator ground pin (MXV_{SS}). ***Do not*** connect to board ground (V_{SS}). The MXV_{DD} pin can be connected to the same 1.8 V power supply as DV_{DDR2}.

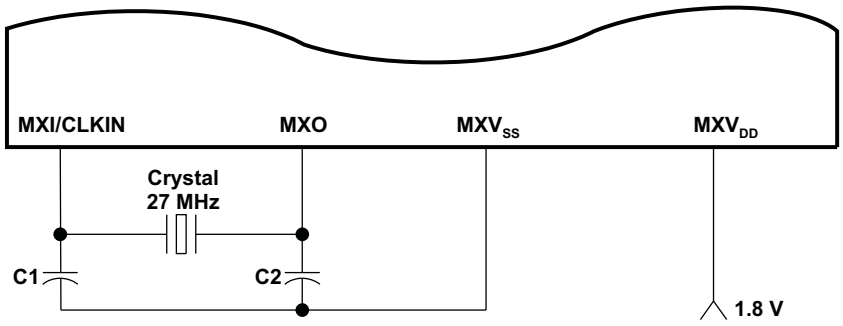


Figure 6-9. 27-MHz System Oscillator

The load capacitors, C1 and C2, should be chosen such that the equation is satisfied (typical values are C1 = C2 = 10 pF). C_L in the equation is the load specified by the crystal manufacturer. All discrete components used to implement the oscillator circuit should be placed as close as possible to the associated oscillator pins (MXI and MXO) and to the MXV_{SS} pin.

$$C_L = \frac{C_1 C_2}{(C_1 + C_2)}$$

Table 6-13. Input Requirements for Crystal

PARAMETER		MIN	TYP	MAX	UNIT
	Start-up time (from power up until oscillating at stable frequency of 27 MHz)			4	ms
	Oscillaton frequency		27		MHz
	ESR			60	Ω
	Frequency Stability(1)			±50	ppm

(1) Applies only when using the VPBE for NTSC or PAL compliant video. For video and audio applications, stability of the input clock is *very* important. The user should select crystals with low enough ppm to ensure good video and audio quality for the specific application. If the VPBE is used for NTSC or PAL compliant video output, TI recommends a 27-MHz, 50-ppm crystal. For more details on this NTSC and PAL compliant output video, see Section 6.10.2, *Video Processing Back-End (VPBE)*.

6.6.2 Clock Input Option 2—1.8-V LVCMOS-Compatible Clock Input

In this option, a 1.8-V LVCMOS-Compatible Clock Input is used as the external clock input to the DM6433. The external connections are shown in Figure 6-10. The MXI/CLKIN pin is connected to the 1.8-V LVCMOS-Compatible clock source. The MXO pin is left unconnected. The MXV_{SS} pin is connected to board ground (V_{SS}). The MXV_{DD} pin can be connected to the same 1.8-V power supply as DV_{DDR2}.

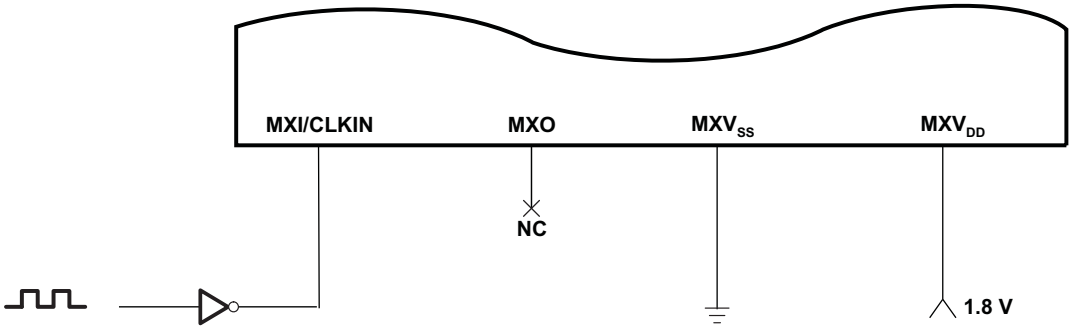

Figure 6-10. 1.8-V LVCMOS-Compatible Clock Input

The clock source ***must*** meet the MXI/CLKIN timing requirements in Section 6.7.4, *Clock PLL Electrical Data/Timing (Input and Output Clocks)*.

6.7 Clock PLLs

There are two independently controlled PLLs on DM6433. PLL1 generates the frequencies required for the DSP, DMA, and other peripherals. PLL2 generates the frequencies required for the DDR2 interface and the VPBE in certain modes. The recommended reference clock for both PLLs is the 27-MHz crystal input.

6.7.1 PLL1 and PLL2

Both PLL1 and PLL2 power is supplied externally via the 1.8 V PLL power-supply pin (PLL_{PWR18}). An external EMI filter circuit ***must*** be added to PLL_{PWR18}, as shown in Figure 6-11. The 1.8-V supply of the EMI filter must be from the same 1.8-V power plane supplying the device's 1.8-V I/O power-supply pins (DV_{DDR2}). TI recommends EMI filter manufacturer Murata, part number NFM18CC222R1C3.

All PLL external components (C1, C2, and the EMI Filter) ***must*** be placed as close to the device as possible. For the best performance, TI recommends that all the PLL external components be on a single side of the board without jumpers, switches, or components other than the ones shown in Figure 6-11. For reduced PLL jitter, maximize the spacing between switching signals and the PLL external components (C1, C2, and the EMI Filter).

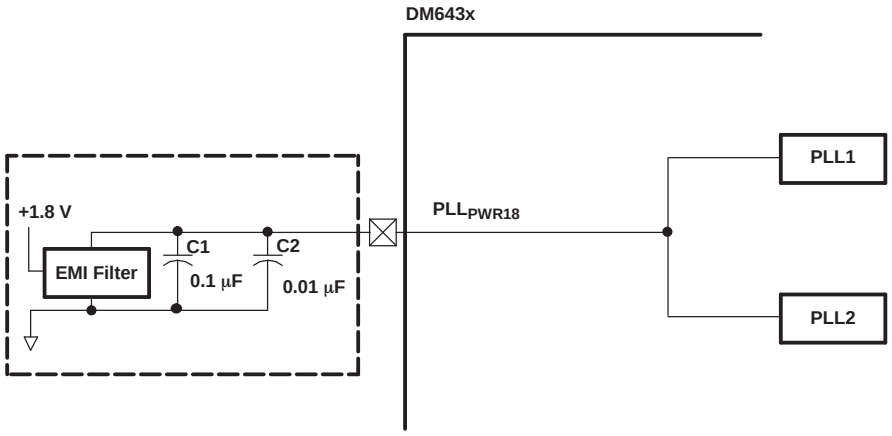

Figure 6-11. PLL1 and PLL2 External Connection

The minimum CLKIN rise and fall times should also be observed. For the input clock timing requirements, see Section 6.7.4, *Clock PLL Electrical Data/Timing (Input and Output Clocks)*.

There is an allowable range for PLL multiplier (PLLM). There is a minimum and maximum operating frequency for MXI/CLKIN, PLLOUT, and the device clocks (SYSCLKs). The PLL Controllers ***must*** be configured not to exceed any of these constraints documented in this section (certain combinations of external clock inputs, internal dividers, and PLL multiply ratios might not be supported). For these constraints (ranges), see Table 6-14 through Table 6-16.

Table 6-14. PLL1 and PLL2 Multiplier Ranges

PLL MULTIPLIER (PLLM)	MIN	MAX
PLL1 Multiplier	x14	x30
PLL2 Multiplier	x14	x32

Table 6-15. PLLC1 Clock Frequency Ranges

CLOCK SIGNAL NAME		MIN	MAX	UNIT
MXI/CLKIN(1)		20	30	MHz
PLLOUT CV_{DD} = 1.2 V	-7 devices	300	700	MHz
	-6/-5/-4/-L/-Q6/-Q5/-Q4 devices	300	600	MHz
PLLOUT CV_{DD} = 1.05 V	-7 devices	300	520	MHz
	-6/-5/-4/-L/-Q5 devices	300	520	MHz
SYSCLK1(2) (CLKDIV1 Domain) CV_{DD} = 1.2 V	-7 devices		700	MHz
	-Q6 devices		660	MHz
	-6/-L devices		600	MHz
	-5/-Q5 devices		500	MHz
	-4/-Q4 devices		400	MHz
SYSCLK1(2) (CLKDIV1 Domain), CV_{DD} = 1.05 V	-7 devices		520	MHz
	-6/-L devices		450	MHz
	-5/-Q5 devices		400	MHz
	-4 devices		350	MHz

(1) MXI/CLKIN input clock is used for both PLL Controllers (PLLC1 and PLLC2).
(2) Applies to "tape and reel" part number counterparts as well. For more information, see Section 2.8, *Device and Development-Support Tool Nomenclature*.

Table 6-16. PLLC2 Clock Frequency Ranges

CLOCK SIGNAL NAME		MIN	MAX	UNIT
MXI/CLKIN(1)		20	30	MHz
PLLOUT	At 1.2-V CV_{DD}	300	900	MHz
	At 1.05-V CV_{DD}	300	666	MHz
PLL2_SYSCLK1 (to DDR2 PHY)			333	MHz

(1) MXI/CLKIN input clock is used for both PLL Controllers (PLLC1 and PLLC2).

Both PLL1 and PLL2 have stabilization, lock, and reset timing requirements that ***must*** be followed.

The PLL stabilization time is the amount of time that ***must*** be allotted for the internal PLL regulators to become stable after the PLL is powered up (after PLLCTL.PLLPWRDN bit goes through a 1-to-0 transition). The PLL should *not* be operated until this stabilization time has expired. This stabilization step ***must*** be applied after these resets—a Power-on Reset, a Warm Reset, or a Max Reset, as the PLLCTL.PLLPWRDN bit resets to a "1". For the PLL stabliziation time value, see Table 6-17.

The PLL reset time is the amount of wait time needed for the PLL to properly reset (writing PLLRST = 0) before bringing the PLL out of reset (writing PLLRST = 1). For the PLL reset time value, see Table 6-17.

The PLL lock time is the amount of time needed from when the PLL is taken out of reset (PLLRST = 1 with PLLEN = 0) to when to when the PLL controller can be switched to PLL mode (PLLEN = 1). For the PLL lock time value, see Table 6-17.

Table 6-17. PLL1 and PLL2 Stabilization, Lock, and Reset Times

PLL STABILIZATION/LOCK/RESET TIME	MIN	TYP	MAX	UNIT
PLL Stabilization Time	150			µs
PLL Lock Time			2000C(1)	ns
PLL Reset Time	128C(1)			ns

(1) C = CLKIN cycle time in ns. For example, when MXI/CLKIN frequency is 27 MHz, use C = 37.$\overline{037}$ ns.

For details on the PLL initialization software sequence, see the*TMS320DM643x DMP DSP Subsystem* Reference Guide (literature number SPRU978).

For more information on the clock domains and their clock ratio restrictions, see Section 6.3.4, *DM6433 Power and Clock Domains*.

6.7.2 PLL Controller Register Description(s)

A summary of the PLL controller registers is shown in Table 6-18. For more details, see the *TMS320DM643x DMP DSP Subsystem* Reference Guide (literature number SPRU978).

Table 6-18. PLL and Reset Controller Registers Memory Map

HEX ADDRESS RANGE	REGISTER ACRONYM	DESCRIPTION

0x01C4 0D54 - 0x01C4 0FFF	–	Reserved

6.7.3 Clock PLL Considerations with External Clock Sources

If the internal oscillator is bypassed, to minimize the clock jitter a single clean power supply should power both the DM6433 device and the external clock oscillator circuit. The minimum CLKIN rise and fall times should also be observed. For the input clock timing requirements, see Section 6.7.4, *Clock PLL Electrical Data/Timing (Input and Output Clocks)*.

Rise/fall times, duty cycles (high/low pulse durations), and the load capacitance of the external clock source must meet the device requirements in this data manual (see Section 5.3, *Electrical Characteristics Over Recommended Ranges of Supply Voltage and Operating Temperature* and Section 6.7.4, *Clock PLL Electrical Data/Timing (Input and Output Clocks)*.

6.7.4 Clock PLL Electrical Data/Timing (Input and Output Clocks)

Table 6-19. Timing Requirements for MXI/CLKIN (1)(2)(3)(4) (see Figure 6-12)

NO.			-7/-6/-5/-4 -L/-Q6/-Q5/-Q4		UNIT
			MIN	MAX	
1	$t_{c(MXI)}$	Cycle time, MXI/CLKIN	33.$\overline{3}$	50	ns
2	$t_{w(MXIH)}$	Pulse duration, MXI/CLKIN high	0.45C	0.55C	ns
3	$t_{w(MXIL)}$	Pulse duration, MXI/CLKIN low	0.45C	0.55C	ns
4	$t_{t(MXI)}$	Transition time, MXI/CLKIN		0.05C	ns
5	$t_{J(MXI)}$	Period jitter, MXI/CLKIN		0.02C	ns
		Frequency Stability(5)		±50	ppm

(1) The MXI/CLKIN frequency and PLL multiply factor should be chosen such that the resulting clock frequency is within the specific range for CPU operating frequency. For example, for a -6 speed device with a 27 MHz CLKIN frequency, the PLL multiply factor should be ≤ 22.
(2) The reference points for the rise and fall transitions are measured at V_{IL} MAX and V_{IH} MIN.
(3) For more details on the PLL multiplier factors, see the *TMS320DM63x DMP DSP Subsystem* Reference Guide (literature number SPRU978).
(4) C = CLKIN cycle time in ns. For example, when MXI/CLKIN frequency is 27 MHz, use C = 37.$\overline{037}$ ns.
(5) Applies only when using the VPBE for NTSC or PAL compliant video. For video and audio applications, stability of the input clock is *very* important. The user should select a clock with low enough ppm to ensure good video and audio quality for the specific application. If the VPBE is used for NTSC or PAL compliant video output, TI recommends a 27-MHz, 50-ppm clock. For more details on this NTSC and PAL compliant output video, see Section 6.10.2, *Video Processing Back-End (VPBE)*.

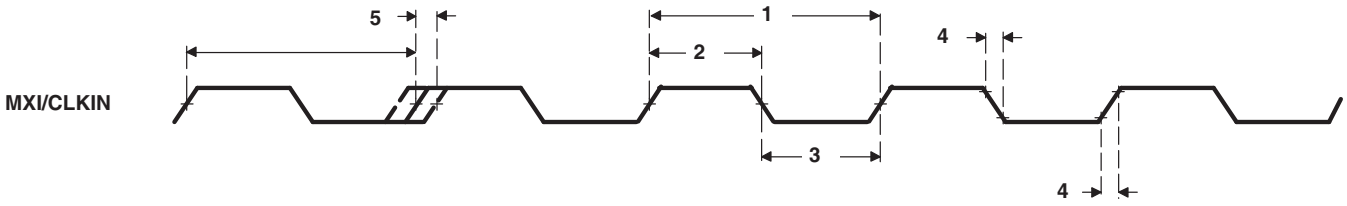

Figure 6-12. MXI/CLKIN Timing

Table 6-20. Switching Characteristics Over Recommended Operating Conditions for CLKOUT0 (1)(2) (see Figure 6-13)

NO.	PARAMETER		-7/-6/-5/-4 -L/-Q6/-Q5/-Q4		UNIT
			MIN	MAX	
1	t_C	Cycle time, CLKOUT0	33.3	50	ns
2	$t_{w(CLKOUT0H)}$	Pulse duration, CLKOUT0 high	0.45P	0.55P	ns
3	$t_{w(CLKOUT0L)}$	Pulse duration, CLKOUT0 low	0.45P	0.55P	ns
4	$t_{t(CLKOUT0)}$	Transition time, CLKOUT0		0.05P	ns

(1) The reference points for the rise and fall transitions are measured at V_{OL} MAX and V_{OH} MIN.
(2) P = 1/CLKOUT0 clock frequency in nanoseconds (ns). For example, when CLKOUT0 frequency is 27 MHz, use P = 37.04 ns.

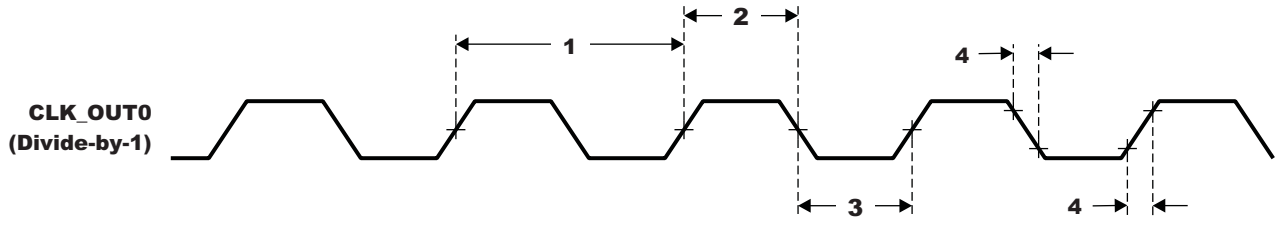

Figure 6-13. CLKOUT0 Timing

6.8 Interrupts

The C64x+ DSP interrupt controller combines device events into 12 prioritized interrupts. The source for each of the 12 CPU interrupts is user programmable and is listed in Table 6-21. Also, the interrupt controller controls the generation of the CPU exception and emulation interrupts. The NMI input to the C64x+ DSP interrupt controller is not connected internally; therefore, the NMI interrupt is not available. Table 6-22 summarizes the C64x+ interrupt controller registers and memory locations. For more details on DSP interrupt controller, see the *TMS320DM643x DMP DSP Subsystem* Reference Guide (literature number SPRU978).

6.9 External Memory Interface (EMIF)

DM6433 supports several memory and external device interfaces, including:

- Asynchronous EMIF (EMIFA) for interfacing to NOR Flash, SRAM, etc.
- NAND Flash

6.9.1 Asynchronous EMIF (EMIFA)

The DM6433 Asynchronous EMIF (EMIFA) provides an 8-bit data bus, an address bus width up to 24-bits, and 4 chip selects, along with memory control signals. These signals are multiplexed between these peripherals:

- EMIFA and NAND interfaces
- VPBE (VENC)
- PCI
- GPIO

6.9.2 NAND (NAND, SmartMedia, xD)

The EMIFA interface provides both the asynchronous EMIF and NAND interfaces. Four chip selects are provided and each are individually configurable to provide either EMIFA or NAND support. The NAND features supported are as follows.

- NAND flash on up to 4 asynchronous chip selects.
- 8-bit data bus width
- Programmable cycle timings.
- Performs ECC calculation.
- NAND Mode also supports SmartMedia and xD memory cards
- Boot ROM supports booting of the DM6433 from NAND flash located at CS2

The memory map for EMIFA and NAND registers is shown in Table 6-23. For more details on the EMIFA and NAND interfaces, see Section 2.9, *Documentation Support* for the link to the *TMS320DM643x DMP Peripherals Overview Reference Guide* (literature number SPRU983) for the *TMS320DM643x Asynchronous External Memory Interface (EMIF) User's Guide* (literature number SPRU984).

13	$t_{h(EMOEH-EMDIV)}$	Hold time, EM_D[7:0] valid after $\overline{EM\_OE}$ high	0			ns
14	$t_{su(EMWAIT-EMOEH)}$	Setup time, EM_WAIT asserted before $\overline{EM\_OE}$ high(2)	4E + 5			ns
WRITES						
28	$t_{su(EMWAIT-EMWEH)}$	Setup time, EM_WAIT asserted before $\overline{EM\_WE}$ high(2)	4E + 5			ns

(1) E = SYSCLK3 period in ns for EMIFA. For example, when running the DSP CPU at 600 MHz, use E = **10** ns.
(2) Setup before end of STROBE phase (if no extended wait states are inserted) by which EM_WAIT must be asserted to add extended wait states. Figure 6-16 and Figure 6-17 describe EMIF transactions that include extended wait states inserted during the STROBE phase. However, cycles inserted as part of this extended wait period should not be counted; the 4E requirement is to the start of where the HOLD phase would begin if there were no extended wait cycles.

6.9.4 DDR2 Memory Controller

The DDR2 Memory Controller is a dedicated interface to DDR2 SDRAM. It supports JESD79D-2A standard compliant DDR2 SDRAM Devices and can interface to either 16-bit or 32-bit DDR2 SDRAM devices. For details on the DDR2 Memory Controller, see the *TMS320DM643x DMP DDR2 Memory Controller* User's Guide (literature number SPRU986).

DDR2 SDRAM plays a key role in a DaVinci-based system. Such a system is expected to require a significant amount of high-speed external memory for:

- Numerous OSD display buffers
- Buffering for intermediate data while performing video decode functions
- Storage of executable code for the DSP

A memory map of the DDR2 Memory Controller registers is shown in Table 6-26.

Table 6-26. DDR2 Memory Controller Registers

6.9.4.1 DDR2 Memory Controller Electrical Data/Timing

The *Implementing DDR2 PCB Layout on the TMS320DM643x DMP DMSoC* Application Report (literature number SPRAAL6) specifies a complete DDR2 interface solution for the DM6433 as well as a list of compatible DDR2 devices. TI has performed the simulation and system characterization to ensure all DDR2 interface timings in this solution are met.

TI only supports board designs that follow the guidelines outlined in the *Implementing DDR2 PCB Layout on the TMS320DM643x DMP DMSoC* Application Report (literature number SPRAAL6).

Table 6-27. Switching Characteristics Over Recommended Operating Conditions for DDR2 Memory Controller(1)(2)(see Figure 6-18)

NO.	PARAMETER		-7/-6/-5/-4 -L/-Q6/-Q5/-Q4		UNIT
			MIN	MAX	
1	$t_{c(DDR\_CLK)}$	Cycle time, DDR_CLK	6	8	ns

(1) DDR_CLK cycle time = 2 x PLL2 _SYSCLK1 cycle time.
(2) The PLL2 Controller ***must*** be programmed such that the resulting DDR_CLK clock frequency is within the specified range.

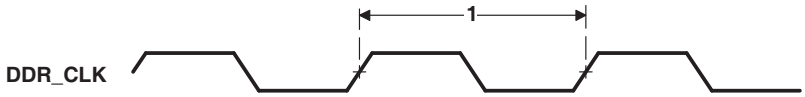

Figure 6-18. DDR2 Memory Controller Clock Timing

6.10 Video Processing Sub-System (VPSS) Overview

The DM6433 Video Processing Sub-System (VPSS) provides a Video Processing Front End (VPFE) input interface for external imaging peripherals (Resizer only) and a Video Processing Back End (VPBE) output interface for display devices, such as analog SDTV displays, digital LCD panels, HDTV video encoders, etc.

The VPSS register memory mapping is shown in Table 6-28.

Table 6-28. VPSS Register Descriptions

HEX ADDRESS RANGE	REGISTER ACRONYM	Description
0x01C7 3400	PID	Peripheral Revision and Class Information
0x01C7 3404	PCR	VPSS Control Register
0x01C7 3408	-	Reserved
0x01C7 3508	SDR_REG_EXP	SDRAM Non Real-Time Read Request Expand
0x01C7 350C - 0x01C7 3FFF	-	Reserved

6.10.1 Video Processing Front-End (VPFE)

The Video Processing Front-End (VPFE) on the DM6433 consists of the Resizer. The Resizer module re-sizes the input image data to the desired display or video encoding resolution.

The VPFE register memory mapping is shown in Table 6-29.

Table 6-29. VPFE Register Address Range Descriptions

HEX ADDRESS RANGE	ACRONYM	REGISTER NAME
0x01C7 0400 – 0x01C7 0BFF		Reserved
0x01C7 0C00 – 0x01C7 09FF	RESZ	VPFE – Resizer
0x01C7 1000 – 0x01C7 17FF		Reserved
0x01C7 3400 – 0x01C7 3FFF	VPSS	VPSS Shared Buffer Logic Registers (see Table 6-28)

6.10.1.1 Resizer

The resizer module can accept input image/video data from the DDR2. The output of the resizer module is sent to DDR2. The following features are supported by the resizer module.

- An output width up to 1280 horizontal pixels.
- Input from external DDR2.
- Up to 4x upsampling (digital zoom).
- Bi-cubic interpolation (4-tap horizontal, 4-tap vertical) can be implemented with the programmable filter coefficients.
- 8 phases of filter coefficients.
- Optional bi-linear interpolation for the chrominance components.
- Up to 1/4x downsampling
- 4-tap horizontal and 4-tap vertical filter coefficients (with 8-phases) for 1x to 1/2x downsampling
- 1/2x to 1/4x downsampling, for 7-tap mode with 4-phases.
- Resizing either YUV 4:2:2 packed data (16-bits) or color separate data (8-bit data within DDR) that is contiguous.
- Separate/independent resizing factor for the horizontal and vertical directions.
- Upsampling and downsampling ratios that are available are: 256/N, with N ranging from 64 to 1024.
- Programmable luminance sharpening after the horizontal resizing and before the vertical resizing step.

The Resizer register memory mapping is shown in Table 6-30.

Table 6-30. Resizer Register Descriptions

HEX ADDRESS RANGE	REGISTER ACRONYM	DESCRIPTION

0x01C7 0CA0	VFILT2928	Vertical Filter Coefficients 29 and 28
0x01C7 0CA4	VFILT3130	Vertical Filter Coefficients 31 and 30
0x01C7 0CA8	YENH	Luminance Enhancer

6.10.2 Video Processing Back-End (VPBE)

The Video Processing Back-End (VPBE) consists of the On-Screen Display (OSD) module, the Video Encoder (VENC) including the Digital LCD (DLCD) and Analog (i.e., DAC) interfaces. The video encoder generates analog video output. The DLCD controller generates digital RGB/YCbCr data output and timing signals.

The VPBE register memory mapping is shown in Table 6-31.

Table 6-31. VPBE Register Descriptions

Address	Register	Description
0x01C7 2780	PID	Peripheral Revision and Class Information Register
0x01C7 2784	PCR	Peripheral Control Register

To ensure NTSC and PAL compliant output video, the stability of the input clock source is ***very*** important. TI recommends a 27-MHz, 50-ppm crystal. *Ceramic oscillators are not recommended*. The NTSC/PAL color sub-carrier frequency is derived from the 27-MHz clock; therefore, if the 27-MHz clock drifts, then the color sub-carrier frequency *will* drift as well. Assuming no 27-MHz frequency drift, the color sub-carrier frequency is generated as follows:

$$f_{sc\text{-}ntsc} = 27\ MHz\left(\frac{35}{264}\right) = 3.5795454545\ MHz$$

$$f_{sc\text{-}pal} = 27\ MHz\left(\frac{167}{1017}\right) = 4.4332628318\ MHz$$

To ensure the color sub-carrier frequency *will not* drift out of specification, the user ***must*** follow the crystal requirements discussed in Section 6.6.1, Clock Input Option 1—Crystal. Alternatively, if the VPBE input clock is sourced from the VPBECLK, this clock ***must*** have a frequency stability of ±50 ppm to ensure NTSC and PAL compliant output video.

6.10.2.1 On-Screen Display (OSD)

The major function of the OSD module is to gather and blend video data and display/bitmap data before feeding it to the Video Encoder (VENC) in YCbCr format. The video and display data is read from an external memory, typically DDR2. The OSD is programmed via control and parameter registers. The following are the primary features that are supported by the OSD.

- Simultaneous display of two video windows and two OSD windows (VIDWIN0/VIDWIN1 and OSDWIN0/OSDWIN1).
  - Separate enable for each window
  - Programmable width, height, and base starting coordinates for each window
  - External memory address and offset registers for each window
  - Support for x2 and x4 zoom in both the horizontal and vertical direction
  - OSDWIN1 can be used as an attribute window for OSDWIN0
  - Attribute window blinking intervals
  - Field/frame mode for the windows (interlaced/progressive)
  - Eight step blending process between the OSD and video windows
  - Transparency support for the OSD and video data (when a bitmap pixel is zero, there will be no blending for that corresponding video pixel)
  - Resize from VGA to NTSC/PAL (640x480 to 720x576) for both the OSD and video windows
  - Reads in YCbCr data in 4:2:2 format from external memory, with the capability for swapping the order of the CbCr component in the 32-bit word (this is relevant to the two video windows)
  - Support for a ping-pong buffer scheme that can be used for VIDWIN0 (allows for video data to be accessed from two different locations in DDR2)
  - Each OSD window (either one, but not both at the same time) is capable of reading in RGB data

(16-bit data with six bits for the green and five bits each for the red and blue colors) instead of bitmap data in YCbCr format restricted to a maximum of 8-bits
  - The OSD bitmap data width is selectable between 1, 2, 4, or 8-bits.
  - Each OSD window supports 16 entries for the bitmap (to index into a 256 entry RAM/ROM CLUT table).
  - Indirect support for 24-bit RGB input data (which will be transformed into 16-bit YCbCr video window data) via the wrapper interface in the VPBE.
- Support for a rectangular cursor window and a programmable background color selection.
  - Programmable color palette with the ability to select between a RAM/ROM table with support for 256 colors.
  - The width, height, and color of the cursor is programmable.
  - The display priority is: Rectangular-Cursor > OSDWIN1 > OSDWIN0 > VIDWIN1 > VIDWIN0 > background color
- Support for attenuation of the YCbCr values for the REC601 standard.

The following restrictions exist in the OSD module.

- Both the OSD windows and VIDWIN1 should be fully contained inside VIDWIN0.
- When one of the OSD windows is set in RGB mode, it cannot overlap with VIDWIN1.
- The OSD cannot support more than 256 color entries in the CLUT RAM/ROM. Some applications require higher number of entries, and one workaround is to use VIDWIN1 as an overlay mimicking the OSD window. Another option is to use the RGB mode for one of the OSD windows which allows for a total of 16-bits for the R, G, and B colors (64K colors).
- The OSD can only read YCbCr in 4:2:2 interleaved format for the video windows. Other formats, either color separate storage or 4:4:4/4:2:0 interleaved data is not supported.
- If the vertical resize filter is enabled for either of the video windows, the maximum horizontal window dimension cannot be greater than 720 currently.
- It is not possible to use both of the CLUT ROMs at the same time. However, one window can use RAM while another uses ROM.
- The 24-bit RGB input mode is only valid for one of the two video windows (programmable) and does not apply to the OSD windows.

The OSD register memory mapping is shown in Table 6-32.

Table 6-32. OSD Register Descriptions

Address	Register	Description
0x01C7 2600	MODE	OSD Mode Register

6.10.2.2 Video Encoder (VENC)

Analog/DACs interface of the Video Encoder (VENC) supports the following features.

- Master Clock Input - 27MHz (x2 Upsampling)
- SDTV Support
  - Composite NTSC-M, PAL-B/D/G/H/I
  - S-Video (Y/C)
  - Component YPbPr (SMPTE/EBU N10, Betacam, MII)
  - RGB
  - Non-Interlace
  - CGMS/WSS
  - Line 21 Closed Caption Data Encoding
  - Chroma Low Pass Filter 1.5MHz/3MHz
  - Programmable SC-H phase
- HDTV Support
  - Progressive Output (525p/625p)
  - Component YPbPr
  - RGB
  - CGMS/WSS
- 4 10-bit Over-Sampling D/A Converters
- Optional 7.5% Pedestal
- 16-235/0-255 Input Amplitude Selectable
- Programmable Luma Delay
- Master/Slave Operation
- Internal Color Bar Generation (100%/75%)

The Digital LCD Controller (DLCD) of the VENC supports the following features.

- Programmable DCLK
- Various Output Formats
  - YCbCr 16bit
  - YCbCr 8bit
  - ITU-R BT. 656
  - Parallel RGB 24bit
- Low Pass Filter for Digital RGB Output
- Programmable Timing Generator
- Master/Slave Operation
- Internal Color Bar Generation (100%/75%)

The VENC register memory mapping including the Digital LCD and DACs is shown in Table 6-33.

Table 6-33. VENC (Including Digital LCD and DACs) Register Descriptions

The DM6433's analog video DAC outputs are designed to drive a 500-Ω load. Figure 6-23 describes a typical circuit that will permit connecting the analog video output from the DM6433 device to standard 75-Ω impedance video systems. Another solution is to use a Video Amplifier, such as the Texas Instruments' OPA361, which provides a complete solution to the typical output circuit shown in Figure 6-23.

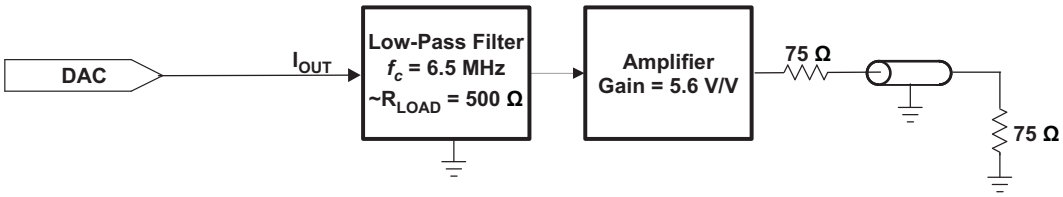

Figure 6-23. Typical Output Circuit for NTSC/PAL Video From DACs

6.11 Universal Asynchronous Receiver/Transmitter (UART)

The DM6433 device has one UART peripheral (UART0). UART0 has the following features:

- 16-byte storage space for both the transmitter and receiver FIFOs
- 1, 4, 8, or 14 byte selectable receiver FIFO trigger level for autoflow control and DMA
- DMA signaling capability for both received and transmitted data
- Programmable auto-rts and auto-cts for autoflow control
- Frequency pre-scale values from 1 to 65,535 to generate appropriate baud rates
- Prioritized interrupts
- Programmable serial data formats
  - 5, 6, 7, or 8-bit characters
  - Even, odd, or no parity bit generation and detection
  - 1, 1.5, or 2 stop bit generation
- False start bit detection
- Line break generation and detection
- Internal diagnostic capabilities
  - Loopback controls for communications link fault isolation
  - Break, parity, overrun, and framing error simulation
- Modem control functions (CTS, RTS)

The UART0 registers are listed in Table 6-40.

6.11.1 UART Peripheral Register Description(s)

Table 6-40. UART0 Register Descriptions

HEX ADDRESS RANGE	ACRONYM	REGISTER NAME
0x01C2 0000	RBR	UART0 Receiver Buffer Register (Read Only)

6.11.2 UART Electrical Data/Timing

Table 6-41. Timing Requirements for UARTx Receive(1) (see Figure 6-24)

NO.			-7/-6/-5/-4 -L/-Q6/-Q5/-Q4		UNIT
			MIN	MAX	
4	$t_{w(URXDB)}$	Pulse duration, receive data bit (URXDx) [15/30/100 pF]	0.96U	1.05U	ns
5	$t_{w(URXSB)}$	Pulse duration, receive start bit [15/30/100 pF]	0.96U	1.05U	ns

(1) U = UART baud time = 1/programmed baud rate.

Table 6-42. Switching Characteristics Over Recommended Operating Conditions for UARTx Transmit(1) (see Figure 6-24)

NO.	PARAMETER		-7/-6/-5/-4 -L/-Q6/-Q5/-Q4		UNIT
			MIN	MAX	
1	$f_{(baud)}$	Maximum programmable baud rate		128	kHz
2	$t_{w(UTXDB)}$	Pulse duration, transmit data bit (UTXDx) [15/30/100 pF]	U - 2	U + 2	ns
3	$t_{w(UTXSB)}$	Pulse duration, transmit start bit [15/30/100 pF]	U - 2	U + 2	ns

(1) U = UART baud time = 1/programmed baud rate.

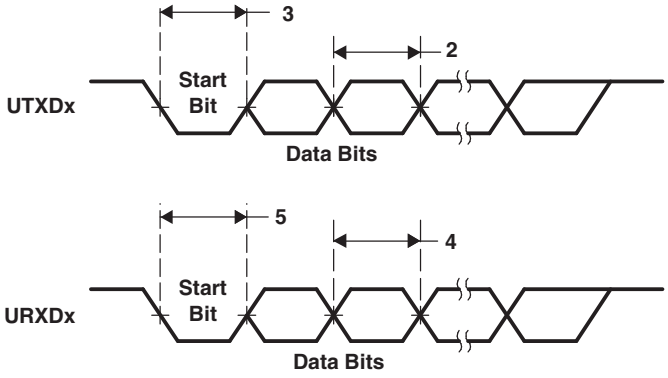

Figure 6-24. UART Transmit/Receive Timing

6.12 Inter-Integrated Circuit (I2C)

The inter-integrated circuit (I2C) module provides an interface between DM6433 and other devices compliant with Philips Semiconductors Inter-IC bus (I^2C-bus™) specification version 2.1. External components attached to this 2-wire serial bus can transmit/receive up to 8-bit data to/from the DSP through the I2C module. The I2C port *does not* support CBUS compatible devices.

The I2C port supports:

- Compatible with Philips I2C Specification Revision 2.1 (January 2000)
- Fast Mode up to 400 Kbps (no fail-safe I/O buffers)
- Noise Filter to Remove Noise 50 ns or less
- Seven- and Ten-Bit Device Addressing Modes
- Master (Transmit/Receive) and Slave (Transmit/Receive) Functionality
- Events: DMA, Interrupt, or Polling
- Slew-Rate Limited Open-Drain Output Buffers

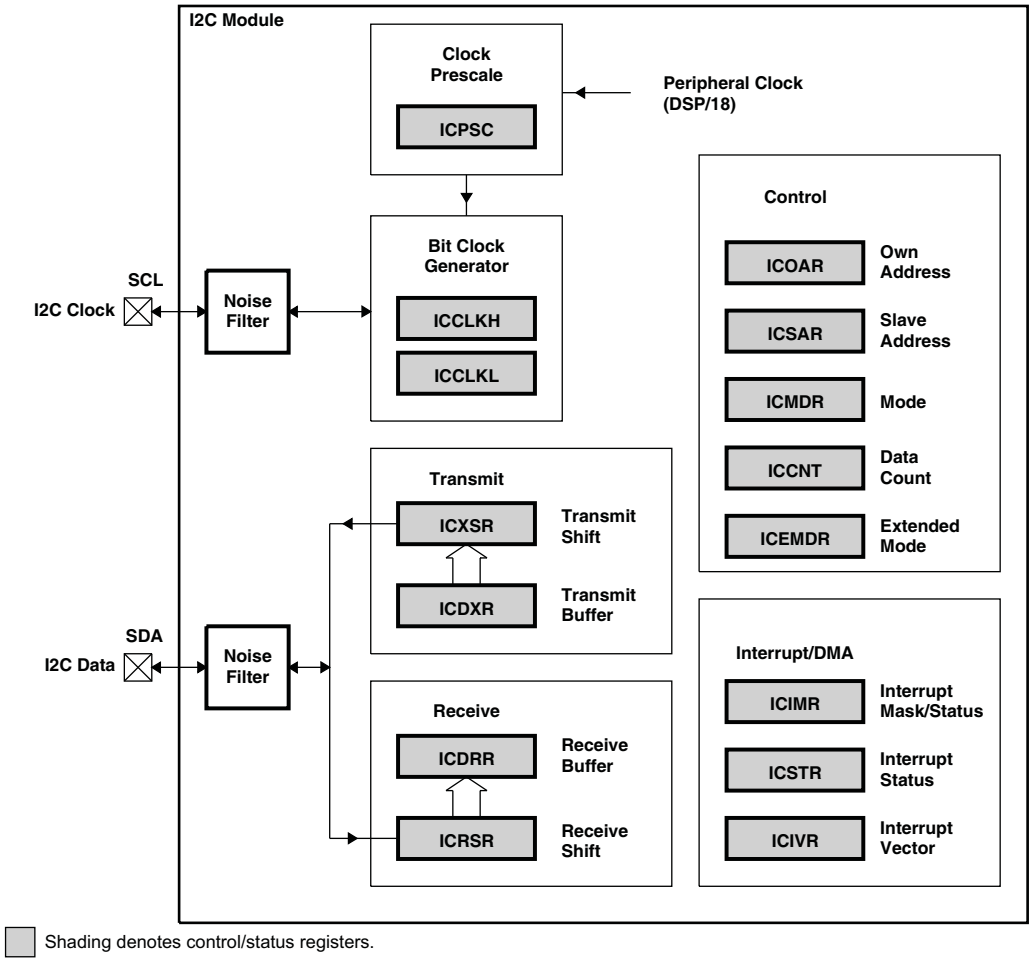

Figure 6-25. I2C Module Block Diagram

For more detailed information on the I2C peripheral, see Section 2.9, *Documentation Support* section of this document for the *TMS320DM643x DMP Peripherals Overview* Reference Guide (literature number SPRU983).

6.12.1 I2C Peripheral Register Description(s)

Table 6-43. I2C Registers

HEX ADDRESS RANGE	ACRONYM	REGISTER NAME
0x1C2 1000	ICOAR	I2C Own Address Register
0x1C2 1004	ICIMR	I2C Interrupt Mask Register
0x1C2 1008	ICSTR	I2C Interrupt Status Register

0x1C2 1038	ICPID2	I2C Peripheral Identification Register 2

6.12.2 I2C Electrical Data/Timing

6.12.2.1 Inter-Integrated Circuits (I2C) Timing

Table 6-44. Timing Requirements for I2C Timings(1) (see Figure 6-26)

NO.			-7/-6/-5/-4 -L/-Q6/-Q5/-Q4				UNIT
			STANDARD MODE		FAST MODE		
			MIN	MAX	MIN	MAX	
1	$t_{c(SCL)}$	Cycle time, SCL	10		2.5		µs
2	$t_{su(SCLH-SDAL)}$	Setup time, SCL high before SDA low (for a repeated START condition)	4.7		0.6		µs
3	$t_{h(SCLL-SDAL)}$	Hold time, SCL low after SDA low (for a START and a repeated START condition)	4		0.6		µs
4	$t_{w(SCLL)}$	Pulse duration, SCL low	4.7		1.3		µs
5	$t_{w(SCLH)}$	Pulse duration, SCL high	4		0.6		µs
6	$t_{su(SDAV-SCLH)}$	Setup time, SDA valid before SCL high	250		100(2)		ns
7	$t_{h(SDA-SCLL)}$	Hold time, SDA valid after SCL low	0(3)		0(3)	0.9(4)	µs
8	$t_{w(SDAH)}$	Pulse duration, SDA high between STOP and START conditions	4.7		1.3		µs
9	$t_{r(SDA)}$	Rise time, SDA		1000	20 + 0.1C_b(5)	300	ns
10	$t_{r(SCL)}$	Rise time, SCL		1000	20 + 0.1C_b(5)	300	ns
11	$t_{f(SDA)}$	Fall time, SDA		300	20 + 0.1C_b(5)	300	ns
12	$t_{f(SCL)}$	Fall time, SCL		300	20 + 0.1C_b(5)	300	ns
13	$t_{su(SCLH-SDAH)}$	Setup time, SCL high before SDA high (for STOP condition)	4		0.6		µs
14	$t_{w(SP)}$	Pulse duration, spike (must be suppressed)			0	50	ns
15	C_b(5)	Capacitive load for each bus line		400		400	pF

(1) The I2C pins SDA and SCL do not feature fail-safe I/O buffers. These pins could potentially draw current when the device is powered down.
(2) A Fast-mode I^2C-bus™ device can be used in a Standard-mode I^2C-bus system, but the requirement $t_{su(SDA-SCLH)} \geq 250$ ns must then be met. This will automatically be the case if the device does not stretch the LOW period of the SCL signal. If such a device does stretch the LOW period of the SCL signal, it must output the next data bit to the SDA line t_r max + $t_{su(SDA-SCLH)}$= 1000 + 250 = 1250 ns (according to the Standard-mode I^2C-Bus Specification) before the SCL line is released.
(3) A device must internally provide a hold time of at least 300 ns for the SDA signal (referred to the V_{IHmin} of the SCL signal) to bridge the undefined region of the falling edge of SCL.
(4) The maximum $t_{h(SDA-SCLL)}$ has only to be met if the device does not stretch the low period [$t_{w(SCLL)}$] of the SCL signal.
(5) C_b = total capacitance of one bus line in pF. If mixed with HS-mode devices, faster fall-times are allowed.

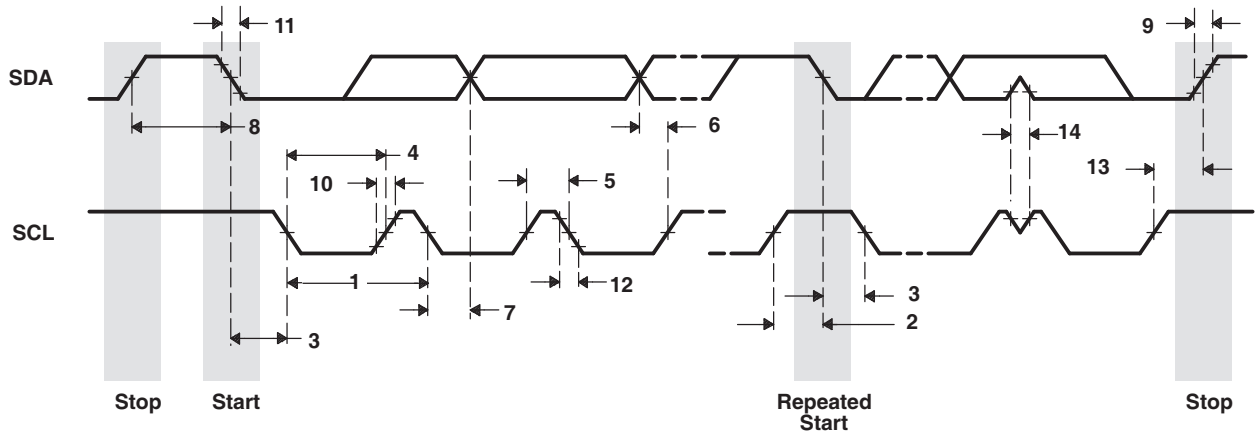

Figure 6-26. I2C Receive Timings

Table 6-45. Switching Characteristics for I2C Timings[1] (see Figure 6-27)

NO.	PARAMETER		-7/-6/-5/-4 -L/-Q6/-Q5/-Q4				UNIT

18	$t_{d(SDAL-SCLL)}$	Delay time, SDA low to SCL low (for a START and a repeated START condition)	4		0.6		µs
19	$t_{w(SCLL)}$	Pulse duration, SCL low	4.7		1.3		µs
20	$t_{w(SCLH)}$	Pulse duration, SCL high	4		0.6		µs
21	$t_{d(SDAV-SCLH)}$	Delay time, SDA valid to SCL high	250		100		ns
22	$t_{v(SCLL-SDAV)}$	Valid time, SDA valid after SCL low	0		0	0.9	µs
23	$t_{w(SDAH)}$	Pulse duration, SDA high between STOP and START conditions	4.7		1.3		µs
24	$t_{r(SDA)}$	Rise time, SDA		1000	$20 + 0.1C_b$[1]	300	ns
25	$t_{r(SCL)}$	Rise time, SCL		1000	$20 + 0.1C_b$[1]	300	ns
26	$t_{f(SDA)}$	Fall time, SDA		300	$20 + 0.1C_b$[1]	300	ns
27	$t_{f(SCL)}$	Fall time, SCL		300	$20 + 0.1C_b$[1]	300	ns
28	$t_{d(SCLH-SDAH)}$	Delay time, SCL high to SDA high (for STOP condition)	4		0.6		µs
29	C_p	Capacitance for each I2C pin		10		10	pF

(1) C_b = total capacitance of one bus line in pF. If mixed with HS-mode devices, faster fall-times are allowed.

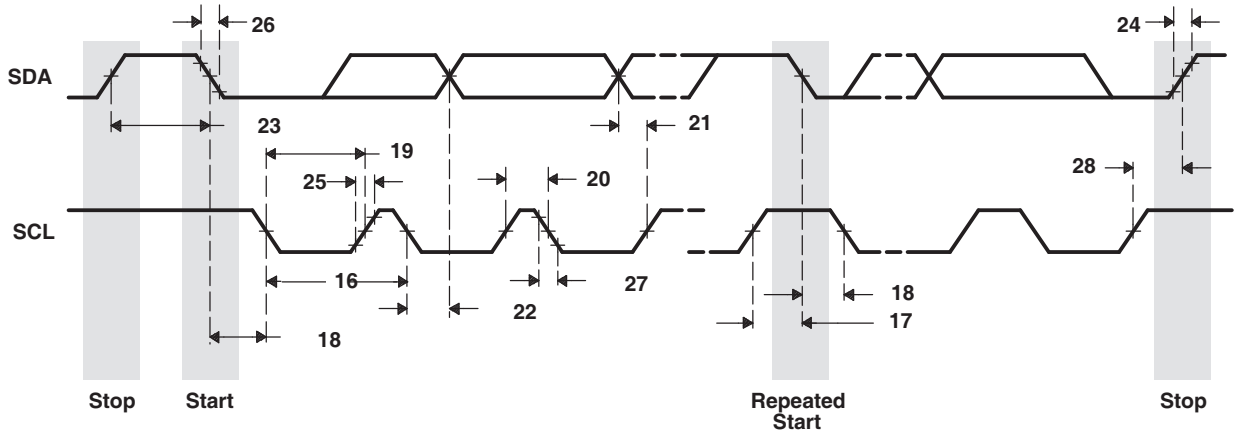

Figure 6-27. I2C Transmit Timings

6.13 Host-Port Interface (HPI) Peripheral

6.13.1 HPI Device-Specific Information

The DM6433 device includes a user-configurable 16-bit Host-port interface (HPI16).

Software handshaking via the HRDY bit of the Host Port Control Register (HPIC) is ***not*** supported on the DM6433.

The DM6433 HPI does ***not*** support the $\overline{\text{HAS}}$ feature. For proper device operation, the $\overline{\text{HAS}}$ pin ***must*** be pulled up via an external resistor.

6.13.2 HPI Peripheral Register Description(s)

Table 6-46. HPI Control Registers

HEX ADDRESS RANGE	ACRONYM	REGISTER NAME	COMMENTS
01C6 7800	PID	Peripheral Identification Register	
01C6 7804	PWREMU_MGMT	HPI power and emulation management register	The CPU has read/write access to the PWREMU_MGMT register.
01C6 7808 - 01C6 7824	-	Reserved	
01C6 7828	-	Reserved	
01C6 782C	-	Reserved	
01C6 7830	HPIC	HPI control register	The Host and the CPU both have read/write access to the HPIC register.
01C6 7834	HPIA (HPIAW)(1)	HPI address register (Write)	The Host has read/write access to the HPIA registers. The CPU has only read access to the HPIA registers.
01C6 7838	HPIA (HPIAR)(1)	HPI address register (Read)	
01C6 780C - 01C6 7FFF	-	Reserved	

(1) There are two 32-bit HPIA registers: HPIAR for read operations and HPIAW for write operations. The HPI can be configured such that HPIAR and HPIAW act as a single 32-bit HPIA (single-HPIA mode) or as two separate 32-bit HPIAs (dual-HPIA mode) from the perspective of the Host. The CPU can access HPIAW and HPIAR independently. For more details about the HPIA registers and their modes, see the *TMS320DM643x DMP Host Port Interface (HPI)* User's Guide (literature number SPRU998).

6.13.3 HPI Electrical Data/Timing

Table 6-47. Timing Requirements for Host-Port Interface Cycles[1][2] (see Figure 6-28 and Figure 6-29)

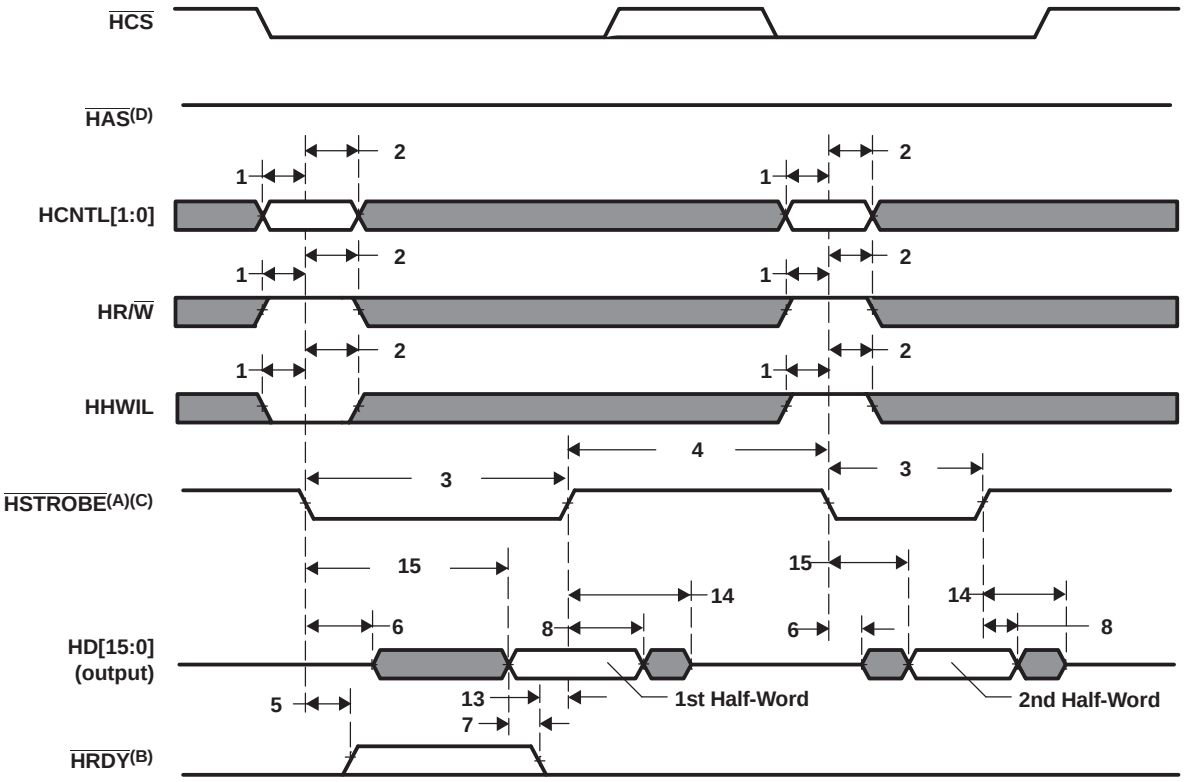
NO.			-7/-6/-5/-4 -L/-Q6/-Q5/-Q4		UNIT
			MIN	MAX	
1	$t_{su(SELV-HSTBL)}$	Setup time, select signals[3] valid before $\overline{\text{HSTROBE}}$ low	5		ns
2	$t_{h(HSTBL-SELV)}$	Hold time, select signals[3] valid after $\overline{\text{HSTROBE}}$ low	2		ns
3	$t_{w(HSTBL)}$	Pulse duration, $\overline{\text{HSTROBE}}$ active low	15		ns
4	$t_{w(HSTBH)}$	Pulse duration, $\overline{\text{HSTROBE}}$ inactive high between consecutive accesses	2M		ns
11	$t_{su(HDV-HSTBH)}$	Setup time, host data valid before $\overline{\text{HSTROBE}}$ high	5		ns
12	$t_{h(HSTBH-HDV)}$	Hold time, host data valid after $\overline{\text{HSTROBE}}$ high	0		ns
13	$t_{h(HRDYL-HSTBL)}$	Hold time, $\overline{\text{HSTROBE}}$ high after $\overline{\text{HRDY}}$ low. $\overline{\text{HSTROBE}}$ should not be inactivated until $\overline{\text{HRDY}}$ is active (low); otherwise, HPI writes will not complete properly.	0		ns

(1) $\overline{\text{HSTROBE}}$ refers to the following logical operation on $\overline{\text{HCS}}$, $\overline{\text{HDS1}}$, and $\overline{\text{HDS2}}$: [NOT($\overline{\text{HDS1}}$ XOR $\overline{\text{HDS2}}$)] OR $\overline{\text{HCS}}$.
(2) M = SYSCLK3 period = (CPU clock frequency)/6 in ns. For example, when running parts at 600 MHz, use M = 10 ns.
(3) Select signals include: HCNTL[1:0], HR/$\overline{\text{W}}$ and HHWIL.

Table 6-48. Switching Characteristics for Host-Port Interface Cycles(1)(2)(3) (see Figure 6-28 and Figure 6-29)

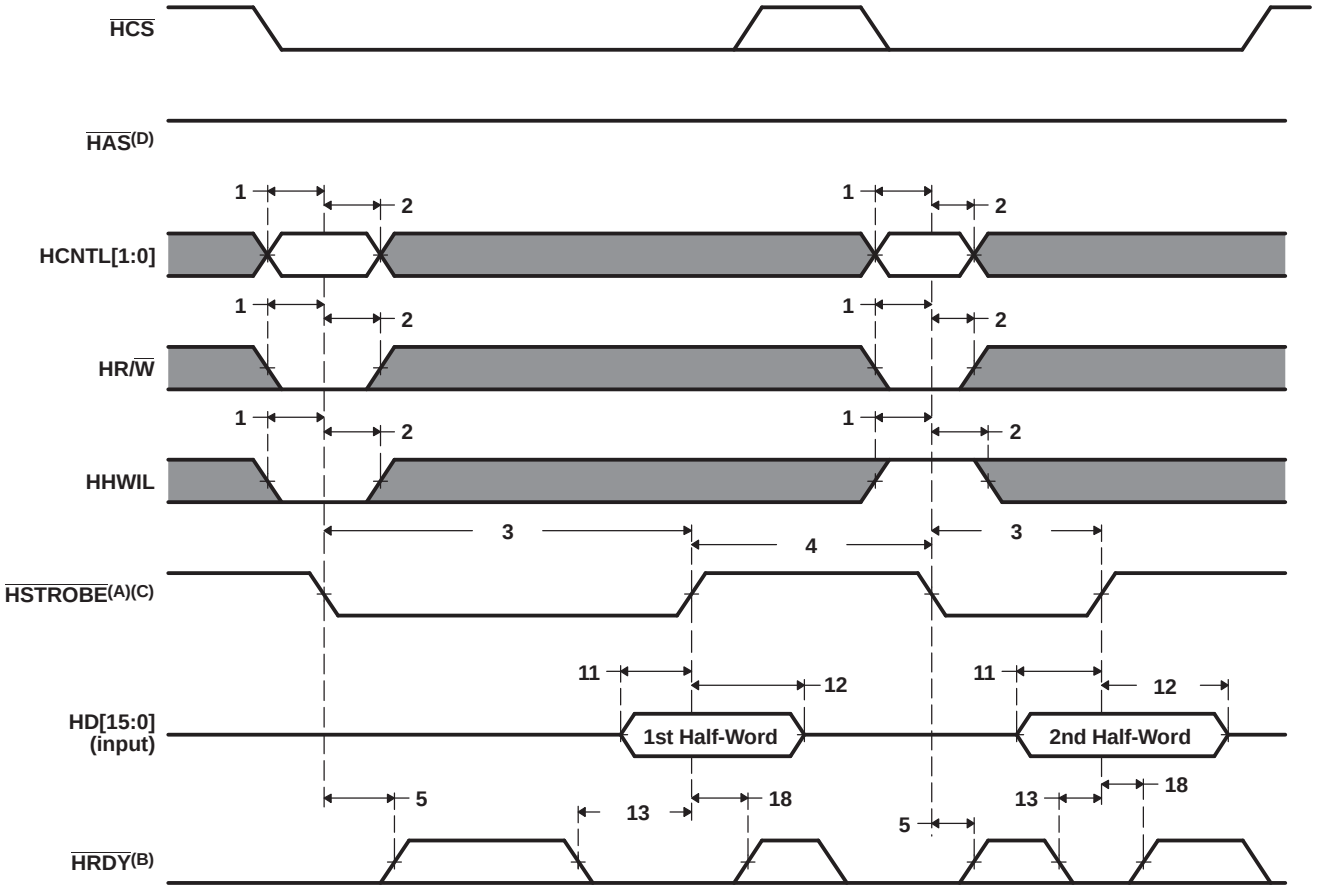
NO.	PARAMETER			-7/-6/-5/-4 -L/-Q6/-Q5/-Q4		UNIT
				MIN	MAX	
5	$t_{d(HSTBL-HRDYV)}$	Delay time, HSTROBE low to HRDY valid	For HPI Write, HRDY can go high (*not ready*) for these HPI Write conditions; otherwise, HRDY stays low (*ready*): *Case 1*: Back-to-back HPIA writes (can be either first or second half-word) *Case 2*: HPIA write following a PREFETCH command (can be either first or second half-word) *Case 3*: HPID write when FIFO is full or flushing (can be either first or second half-word) *Case 4*: HPIA write and Write FIFO not empty For HPI Read, HRDY can go high (*not ready*) for these HPI Read conditions: *Case 1*: HPID read (with auto-increment) and data not in Read FIFO (can only happen to first half-word of HPID access) *Case 2*: First half-word access of HPID Read without auto-increment For HPI Read, HRDY stays low (*ready*) for these HPI Read conditions: *Case 1*: HPID read with auto-increment and data is already in Read FIFO (applies to either half-word of HPID access) *Case 2*: HPID read without auto-increment and data is already in Read FIFO (always applies to second half-word of HPID access) *Case 3*: HPIC or HPIA read (applies to either half-word access)		12	ns
6	$t_{en(HSTBL-HD)}$	Enable time, HD driven from HSTROBE low		2		ns
7	$t_{d(HRDYL-HDV)}$	Delay time, HRDY low to HD valid			0	ns
8	$t_{oh(HSTBH-HDV)}$	Output hold time, HD valid after HSTROBE high		1.5		ns
14	$t_{dis(HSTBH-HDV)}$	Disable time, HD high-impedance from HSTROBE high			12	ns
15	$t_{d(HSTBL-HDV)}$	Delay time, HSTROBE low to HD valid	For HPI Read. Applies to conditions where data is already residing in HPID/FIFO: *Case 1*: HPIC or HPIA read *Case 2*: First half-word of HPID read with auto-increment and data is already in Read FIFO *Case 3*: Second half-word of HPID read with or without auto-increment		15	ns
18	$t_{d(HSTBH-HRDYV)}$	Delay time, HSTROBE high to HRDY valid	For HPI Write, HRDY can go high (*not ready*) for these HPI Write conditions; otherwise, HRDY stays low (*ready*): *Case 1*: HPID write when Write FIFO is full (can happen to either half-word) *Case 2*: HPIA write (can happen to either half-word) *Case 3*: HPID write without auto-increment (only happens to second half-word)		12	ns

(1) M = SYSCLK3 period = (CPU clock frequency)/6 in ns. For example, when running parts at 600 MHz, use M = 10 ns.
(2) HSTROBE refers to the following logical operation on HCS, HDS1, and HDS2: [NOT(HDS1 XOR HDS2)] OR HCS.
(3) By design, whenever HCS is driven inactive (high), HPI will drive HRDY active (low).



A. HSTROBE refers to the following logical operation on HCS, HDS1, and HDS2: [NOT(HDS1 XOR HDS2)] OR HCS.
B. Depending on the type of write or read operation (HPID without auto-incrementing; HPIA, HPIC, or HPID with auto-incrementing) and the state of the FIFO, transitions on HRDY may or may not occur.
For more detailed information on the HPI peripheral, see the *TMS320DM643x Host Port Interface (HPI)* User's Guide (literature number SPRU998).
C. HCS reflects typical HCS behavior when HSTROBE assertion is caused by HDS1 or HDS2. HCS timing requirements are reflected by parameters for HSTROBE.
D For proper HPI operation, HAS must be pulled up via an external resistor.

Figure 6-28. HPI16 Read Timing (HAS Not Used, Tied High)



A. HSTROBE refers to the following logical operation on HCS, HDS1, and HDS2: [NOT(HDS1 XOR HDS2)] OR HCS.
B. Depending on the type of write or read operation (HPID without auto-incrementing; HPIA, HPIC, or HPID with auto-incrementing) and the state of the FIFO, transitions on HRDY may or may not occur.
For more detailed information on the HPI peripheral, see the *TMS320DM643x Host Port Interface (HPI)* User's Guide (literature number SPRU998).
C. HCS reflects typical HCS behavior when HSTROBE assertion is caused by HDS1 or HDS2. HCS timing requirements are reflected by parameters for HSTROBE.
D For proper HPI operation, HAS must be pulled up via an external resistor.

Figure 6-29. HPI16 Write Timing (HAS Not Used, Tied High)

6.14 Multichannel Buffered Serial Port (McBSP)

The McBSP provides these functions:

- Full-duplex communication
- Double-buffered data registers, which allow a continuous data stream
- Independent framing and clocking for receive and transmit
- Direct interface to industry-standard codecs, analog interface chips (AICs), and other serially connected analog-to-digital (A/D) and digital-to-analog (D/A) devices
- External shift clock or an internal, programmable frequency shift clock for data transfer

If internal clock source is used, the CLKGDV field of the Sample Rate Generator Register (SRGR) must always be set to a value of 1 or greater.

For more detailed information on the McBSP peripheral, see the *TMS320DM643x DMP Multichannel Buffered Serial Port (McBSP)* User's Guide (literature number SPRU943).

6.14.1 McBSP Peripheral Register Description(s)

Table 6-49. McBSP 0 Registers

HEX ADDRESS RANGE	ACRONYM	REGISTER NAME	COMMENTS
01D0 0000	DRR0	McBSP0 Data Receive Register	The CPU and EDMA3 controller can only read this register; they cannot write to it.

01D0 0040 - 01D0 07FF	-	Reserved	

6.14.2 McBSP Electrical Data/Timing

6.14.2.1 Multichannel Buffered Serial Port (McBSP) Timing

Table 6-50. Timing Requirements for McBSP[1] (see Figure 6-30)

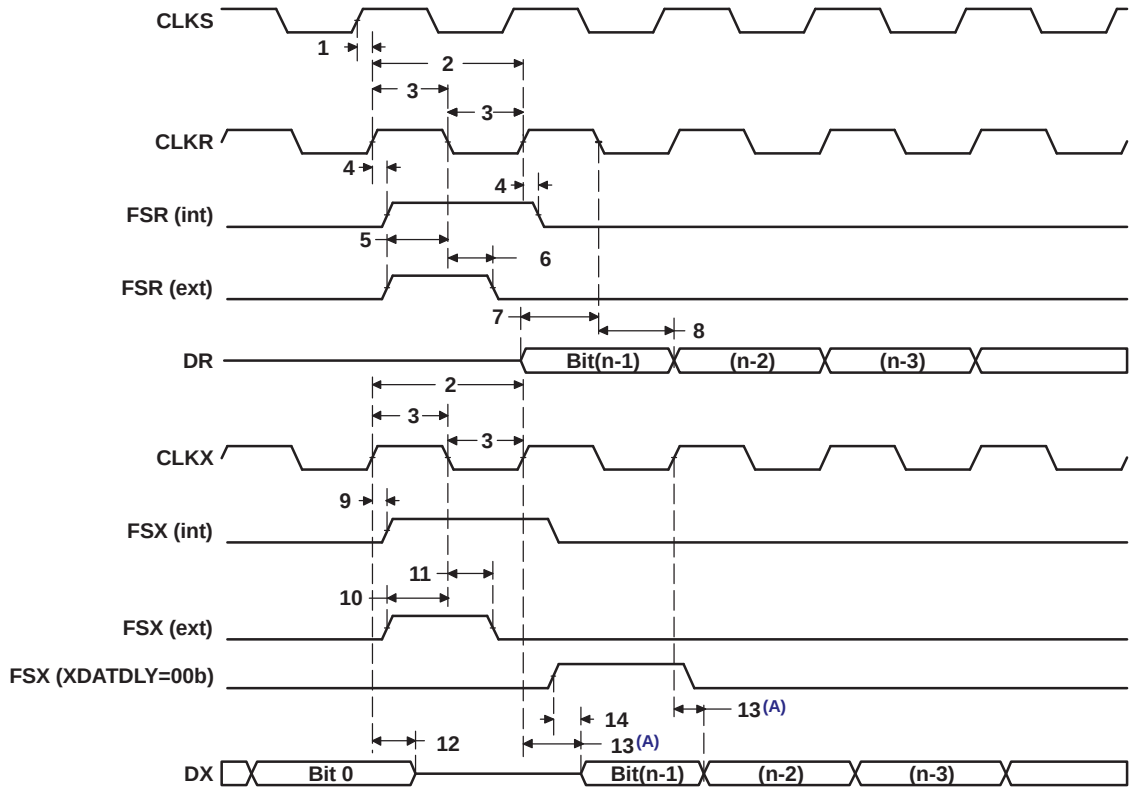
NO.				-7/-6/-5/-4 -L/-Q6/-Q5/-Q4		UNIT
				MIN	MAX	
2	$t_{c(CKRX)}$	Cycle time, CLKR/X	CLKR/X ext	2P[2][3]		ns
3	$t_{w(CKRX)}$	Pulse duration, CLKR/X high or CLKR/X low	CLKR/X ext	P - 1[4]		ns
5	$t_{su(FRH-CKRL)}$	Setup time, external FSR high before CLKR low	CLKR int	14		ns
			CLKR ext	4		
6	$t_{h(CKRL-FRH)}$	Hold time, external FSR high after CLKR low	CLKR int	6		ns
			CLKR ext	4		
7	$t_{su(DRV-CKRL)}$	Setup time, DR valid before CLKR low	CLKR int	14		ns
			CLKR ext	4		
8	$t_{h(CKRL-DRV)}$	Hold time, DR valid after CLKR low	CLKR int	3		ns
			CLKR ext	3.5		
10	$t_{su(FXH-CKXL)}$	Setup time, external FSX high before CLKX low	CLKX int	14		ns
			CLKX ext	4		
11	$t_{h(CKXL-FXH)}$	Hold time, external FSX high after CLKX low	CLKX int	6		ns
			CLKX ext	3		

(1) CLKRP = CLKXP = FSRP = FSXP = 0. If polarity of any of the signals is inverted, then the timing references of that signal are also inverted.
(2) P = SYSCLK3 period in ns. For example, when running parts at 600 MHz, use P = 10 ns.
(3) Use whichever value is greater. Minimum CLKR/X cycle times *must* be met, even when CLKR/X is generated by an internal clock source. The minimum CLKR/X cycle times are based on internal logic speed; the maximum usable speed may be lower due to EDMA limitations and AC timing requirements.
(4) This parameter applies to the maximum McBSP frequency. Operate serial clocks (CLKR/X) in the reasonable range of 40/60 duty cycle.

Table 6-51. Switching Characteristics Over Recommended Operating Conditions for McBSP[1][2] (see Figure 6-30)

NO.	PARAMETER			-7/-6/-5/-4 -L/-Q6/-Q5/-Q4		UNIT
				MIN	MAX	
1	$t_{d(CKSH-CKRXH)}$	Delay time, CLKS high to CLKR/X high for internal CLKR/X generated from CLKS input		3	10	ns
2	$t_{c(CKRX)}$	Cycle time, CLKR/X	CLKR/X int	2P[3][4][5]		ns
3	$t_{w(CKRX)}$	Pulse duration, CLKR/X high or CLKR/X low	CLKR/X int	C - 2[6]	C + 2[6]	ns
4	$t_{d(CKRH-FRV)}$	Delay time, CLKR high to internal FSR valid	CLKR int	-4	5.5	ns
9	$t_{d(CKXH-FXV)}$	Delay time, CLKX high to internal FSX valid	CLKX int	-4	5.5	ns
			CLKX ext	2.5	14.5	
12	$t_{dis(CKXH-DXHZ)}$	Disable time, DX high impedance following last data bit from CLKX high	CLKX int	-5.5	7.5	ns
			CLKX ext	-2.1	16	
13	$t_{d(CKXH-DXV)}$	Delay time, CLKX high to DX valid	CLKX int	-4 + D1[7]	5.5 + D2[7]	ns
			CLKX ext	2.5 + D1[7]	14.5 + D2[7]	
14	$t_{d(FXH-DXV)}$	Delay time, FSX high to DX valid ONLY applies when in data delay 0 (XDATDLY = 00b) mode	FSX int	-4[8]	5[8]	ns
			FSX ext	1[8]	14.5[8]	

(1) CLKRP = CLKXP = FSRP = FSXP = 0. If polarity of any of the signals is inverted, then the timing references of that signal are also inverted.
(2) Minimum delay times also represent minimum output hold times.
(3) Minimum CLKR/X cycle times must be met, even when CLKR/X is generated by an internal clock source. Minimum CLKR/X cycle times are based on internal logic speed; the maximum usable speed may be lower due to EDMA limitations and AC timing requirements.
(4) P = SYSCLK3 period in ns. For example, when running parts at 600 MHz, use P = 10 ns.
(5) Use whichever value is greater.
(6) C = H or L
S = sample rate generator input clock = P if CLKSM = 1 (P = SYSCLK3 period)
S = sample rate generator input clock = P_clks if CLKSM = 0 (P_clks = CLKS period)
H = CLKX high pulse width = (CLKGDV/2 + 1) * S if CLKGDV is even
H = (CLKGDV + 1)/2 * S if CLKGDV is odd
L = CLKX low pulse width = (CLKGDV/2) * S if CLKGDV is even
L = (CLKGDV + 1)/2 * S if CLKGDV is odd
CLKGDV should be set appropriately to ensure the McBSP bit rate does not exceed the maximum limit (see (4) above).
(7) Extra delay from CLKX high to DX valid **applies *only* to the first data bit of a device**, if and only if DXENA = 1 in SPCR.
if DXENA = 0, then D1 = D2 = 0
if DXENA = 1, then D1 = 6P, D2 = 12P
(8) Extra delay from FSX high to DX valid **applies *only* to the first data bit of a device**, if and only if DXENA = 1 in SPCR.
if DXENA = 0, then D1 = D2 = 0
if DXENA = 1, then D1 = 6P, D2 = 12P



A. Parameter No. 13 applies to the first data bit *only* when XDATDLY ≠ 0.

6	$t_{dis(CKXH-DXHZ)}$	Disable time, DX high impedance following last data bit from CLKX high	H - 6	H + 7.5			ns
7	$t_{dis(FXH-DXHZ)}$	Disable time, DX high impedance following last data bit from FSX high			P + 3	3P + 17	ns
8	$t_{d(FXL-DXV)}$	Delay time, FSX low to DX valid			2P + 2	4P + 17	ns

(1) P = SYSCLK3 period in ns. For example, when running parts at 600 MHz, use P = 10 ns.
(2) For all SPI Slave modes, the rate of the internal clock CLKG must be at least 8 times faster than that of the SPI data rate. User should program sample rate generator to achieve maximum CLKG by setting CLKSM = CLKGDV = 1.
(3) S = Sample rate generator input clock = 2P if CLKSM = 1 (P = SYSCLK3 period)
S = Sample rate generator input clock = 2P_clks if CLKSM = 0 (P_clks = CLKS period)
T = CLKX period = (1 + CLKGDV) * S
H = CLKX high pulse width = (CLKGDV/2 + 1) * S if CLKGDV is even
H = (CLKGDV + 1)/2 * S if CLKGDV is odd
L = CLKX low pulse width = (CLKGDV/2) * S if CLKGDV is even
L = (CLKGDV + 1)/2 * S if CLKGDV is odd
(4) FSRP = FSXP = 1. As a SPI Master, FSX is inverted to provide active-low slave-enable output. As a Slave, the active-low signal input on FSX and FSR is inverted before being used internally.
CLKXM = FSXM = 1, CLKRM = FSRM = 0 for Master McBSP
CLKXM = CLKRM = FSXM = FSRM = 0 for Slave McBSP
(5) FSX should be low before the rising edge of clock to enable Slave devices and then begin a SPI transfer at the rising edge of the Master clock (CLKX).

6.15 Multichannel Audio Serial Port (McASP0) Peripheral

The McASP functions as a general-purpose audio serial port optimized for the needs of multichannel audio applications. The McASP is useful for time-division multiplexed (TDM) stream, Inter-Integrated Sound (I2S) protocols, and intercomponent digital audio interface transmission (DIT).

6.15.1 McASP0 Device-Specific Information

The DM6433 device includes one multichannel audio serial port (McASP) interface peripheral (McASP0). The McASP0 is a serial port optimized for the needs of multichannel audio applications.

The McASP0 consists of a transmit and receive section. These sections can operate completely independently with different data formats, separate master clocks, bit clocks, and frame syncs or alternatively, the transmit and receive sections may be synchronized. The McASP module also includes a pool of 16 shift registers that may be configured to operate as either transmit data or receive data.

The transmit section of the McASP can transmit data in either a time-division-multiplexed (TDM) synchronous serial format or in a digital audio interface (DIT) format where the bit stream is encoded for S/PDIF, AES-3, IEC-60958, CP-430 transmission. The receive section of the McASP supports the TDM synchronous serial format.

The McASP can support one transmit data format (either a TDM format or DIT format) and one receive format at a time. All transmit shift registers use the same format and all receive shift registers use the same format. However, the transmit and receive formats need not be the same.

Both the transmit and receive sections of the McASP also support burst mode which is useful for non-audio data (for example, passing control information between two DSPs).

The McASP peripheral has additional capability for flexible clock generation, and error detection/handling, as well as error management.

For more detailed information on and the functionality of the McASP0 peripheral, see the *TMS320DM643x DMP Multichannel Audio Serial Port (McASP)* User's Guide (literature number SPRU980).

6.15.1.1 McASP Block Diagram

Figure 6-36 illustrates the major blocks along with external signals of the TMS320DM6433 McASP0 peripheral; and shows the 4 serial data [AXR] pins.

ACLKR external input: ACLKRCTL.CLKRM=0, PDIR.ACLKR=0
ACLKR external output: ACLKRCTL.CLKRM=0, PDIR.ACLKR=1

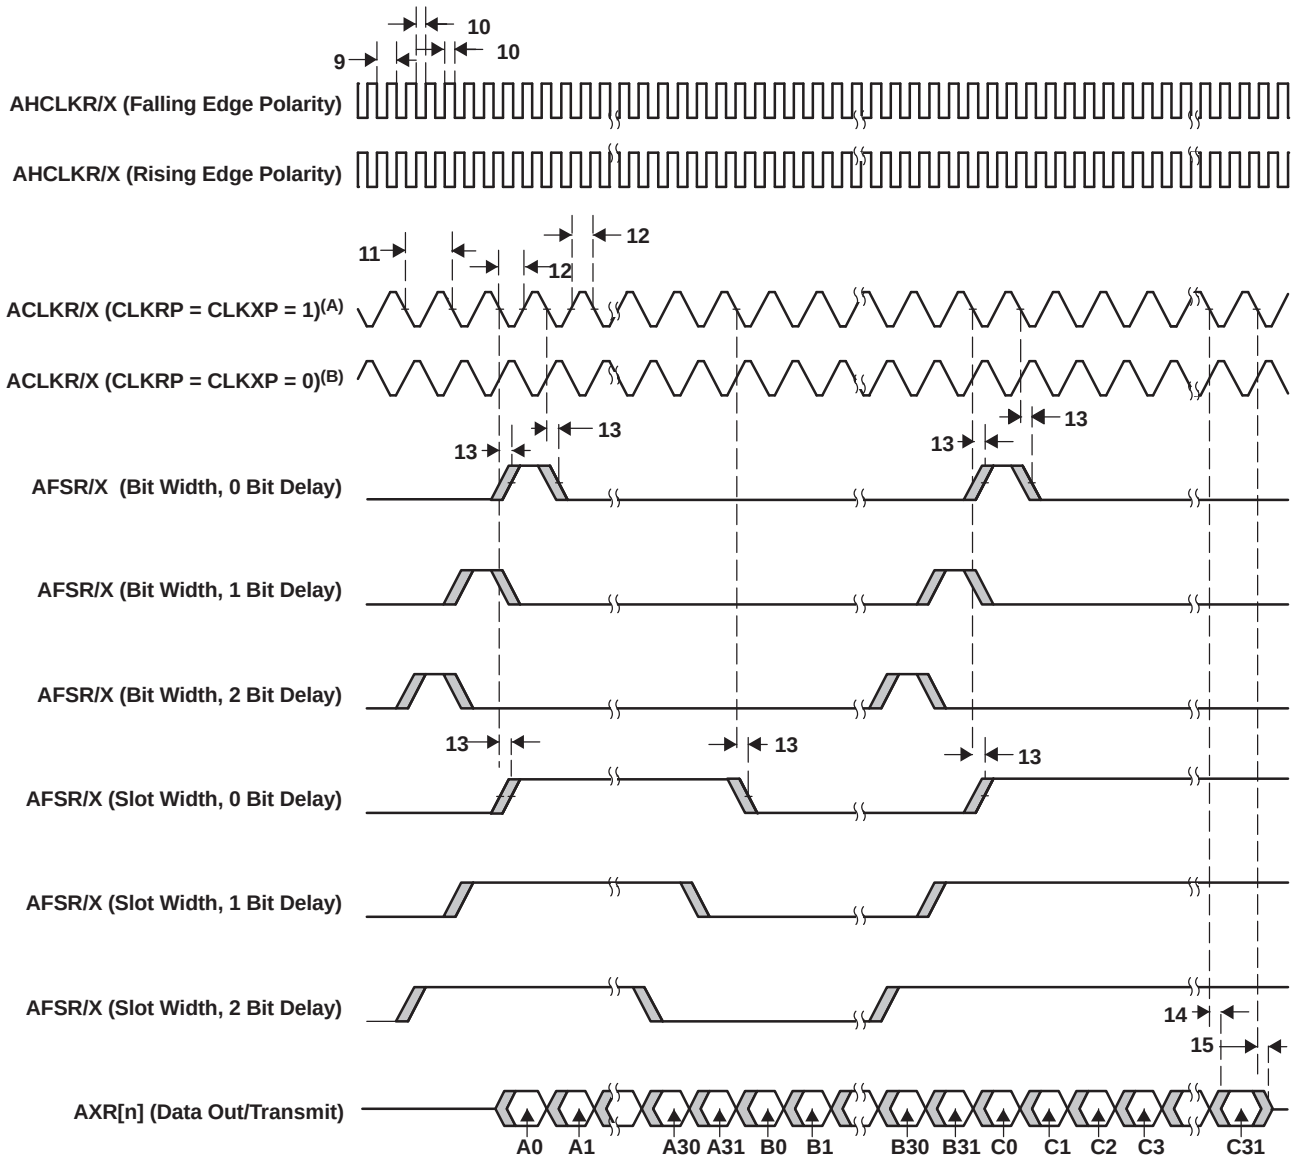
A. For CLKRP = CLKXP = 0, the McASP transmitter is configured for rising edge (to shift data out) and the McASP receiver is configured for falling edge (to shift data in).

B. For CLKRP = CLKXP = 1, the McASP transmitter is configured for falling edge (to shift data out) and the McASP receiver is configured for rising edge (to shift data in).

Figure 6-37. McASP Input Timings



A. For CLKRP = CLKXP = 1, the McASP transmitter is configured for falling edge (to shift data out) and the McASP receiver is configured for rising edge (to shift data in).

B. For CLKRP = CLKXP = 0, the McASP transmitter is configured for rising edge (to shift data out) and the McASP receiver is configured for falling edge (to shift data in).

Figure 6-38. McASP Output Timings

6.16 Ethernet Media Access Controller (EMAC)

The Ethernet Media Access Controller (EMAC) provides an efficient interface between DM6433 and the network. The DM6433 EMAC supports both 10Base-T (10 Mbits/second [Mbps]) and 100Base-TX (100 Mbps) in either half- or full-duplex mode. The EMAC module also supports hardware flow control and quality of service (QOS) support.

The EMAC controls the flow of packet data from the DM6433 device to the PHY. The MDIO module controls PHY configuration and status monitoring.

The EMAC module conforms to the IEEE 802.3-2002 standard, describing the “Carrier Sense Multiple Access with Collision Detection (CSMA/CD) Access Method and Physical Layer” specifications. The IEEE 802.3 standard has also been adopted by ISO/IEC and re-designated as ISO/IEC 8802-3:2000(E).

Deviation from this standard, the EMAC module does not use the Transmit Coding Error signal MTXER. Instead of driving the error pin when an underflow condition occurs on a transmitted frame, the EMAC will intentionally generate an incorrect checksum by inverting the frame CRC, so that the transmitted frame will be detected as an error by the network.

Both the EMAC and the MDIO modules interface to the DM6433 device through a custom interface that allows efficient data transmission and reception. This custom interface is referred to as the EMAC control module, and is considered integral to the EMAC/MDIO peripheral. The control module is also used to multiplex and control interrupts.

For the *DM6433 Ethernet Media Access Controller (EMAC)/Management Data Input/Output (MDIO) Module* User's Guide (literature number SPRU941) which describes the DM6433 EMAC peripheral in detail, see Section 2.9, *Documentation Support* section . For a list of supported registers and register fields, see Table 6-65 [Ethernet MAC (EMAC) Control Registers] and Table 6-66 [EMAC Statistics Registers] in this data manual.

01C8 0624	RX1HDP	Receive Channel 1 DMA Head Descriptor Pointer Register
01C8 0628	RX2HDP	Receive Channel 2 DMA Head Descriptor Pointer Register
01C8 062C	RX3HDP	Receive Channel 3 DMA Head Descriptor Pointer Register
01C8 0630	RX4HDP	Receive Channel 4 DMA Head Descriptor Pointer Register
01C8 0634	RX5HDP	Receive Channel 5 DMA Head Descriptor Pointer Register
01C8 0638	RX6HDP	Receive Channel 6 DMA Head Descriptor Pointer Register
01C8 063C	RX7HDP	Receive Channel 7 DMA Head Descriptor Pointer Register
01C8 0640	TX0CP	Transmit Channel 0 Completion Pointer (Interrupt Acknowledge) Register
01C8 0644	TX1CP	Transmit Channel 1 Completion Pointer (Interrupt Acknowledge) Register
01C8 0648	TX2CP	Transmit Channel 2 Completion Pointer (Interrupt Acknowledge) Register
01C8 064C	TX3CP	Transmit Channel 3 Completion Pointer (Interrupt Acknowledge) Register
01C8 0650	TX4CP	Transmit Channel 4 Completion Pointer (Interrupt Acknowledge) Register
01C8 0654	TX5CP	Transmit Channel 5 Completion Pointer (Interrupt Acknowledge) Register
01C8 0658	TX6CP	Transmit Channel 6 Completion Pointer (Interrupt Acknowledge) Register
01C8 065C	TX7CP	Transmit Channel 7 Completion Pointer (Interrupt Acknowledge) Register
01C8 0660	RX0CP	Receive Channel 0 Completion Pointer (Interrupt Acknowledge) Register
01C8 0664	RX1CP	Receive Channel 1 Completion Pointer (Interrupt Acknowledge) Register
01C8 0668	RX2CP	Receive Channel 2 Completion Pointer (Interrupt Acknowledge) Register
01C8 066C	RX3CP	Receive Channel 3 Completion Pointer (Interrupt Acknowledge) Register
01C8 0670	RX4CP	Receive Channel 4 Completion Pointer (Interrupt Acknowledge) Register
01C8 0674	RX5CP	Receive Channel 5 Completion Pointer (Interrupt Acknowledge) Register
01C8 0678	RX6CP	Receive Channel 6 Completion Pointer (Interrupt Acknowledge) Register
01C8 067C	RX7CP	Receive Channel 7 Completion Pointer (Interrupt Acknowledge) Register

Table 6-66. EMAC Statistics Registers

HEX ADDRESS RANGE	ACRONYM	REGISTER NAME
01C8 0200	RXGOODFRAMES	Good Receive Frames Register
01C8 0204	RXBCASTFRAMES	Broadcast Receive Frames Register (Total number of good broadcast frames received)
01C8 0208	RXMCASTFRAMES	Multicast Receive Frames Register (Total number of good multicast frames received)
01C8 020C	RXPAUSEFRAMES	Pause Receive Frames Register
01C8 0210	RXCRCERRORS	Receive CRC Errors Register (Total number of frames received with CRC errors)
01C8 0214	RXALIGNCODEERRORS	Receive Alignment/Code Errors Register (Total number of frames received with alignment/code errors)
01C8 0218	RXOVERSIZED	Receive Oversized Frames Register (Total number of oversized frames received)
01C8 021C	RXJABBER	Receive Jabber Frames Register (Total number of jabber frames received)
01C8 0220	RXUNDERSIZED	Receive Undersized Frames Register (Total number of undersized frames received)
01C8 0224	RXFRAGMENTS	Receive Frame Fragments Register
01C8 0228	RXFILTERED	Filtered Receive Frames Register
01C8 022C	RXQOSFILTERED	Received QOS Filtered Frames Register
01C8 0230	RXOCTETS	Receive Octet Frames Register (Total number of received bytes in good frames)
01C8 0234	TXGOODFRAMES	Good Transmit Frames Register (Total number of good frames transmitted)
01C8 0238	TXBCASTFRAMES	Broadcast Transmit Frames Register
01C8 023C	TXMCASTFRAMES	Multicast Transmit Frames Register
01C8 0240	TXPAUSEFRAMES	Pause Transmit Frames Register
01C8 0244	TXDEFERRED	Deferred Transmit Frames Register
01C8 0248	TXCOLLISION	Transmit Collision Frames Register
01C8 024C	TXSINGLECOLL	Transmit Single Collision Frames Register
01C8 0250	TXMULTICOLL	Transmit Multiple Collision Frames Register
01C8 0254	TXEXCESSIVECOLL	Transmit Excessive Collision Frames Register
01C8 0258	TXLATECOLL	Transmit Late Collision Frames Register
01C8 025C	TXUNDERRUN	Transmit Underrun Error Register
01C8 0260	TXCARRIERSENSE	Transmit Carrier Sense Errors Register
01C8 0264	TXOCTETS	Transmit Octet Frames Register
01C8 0268	FRAME64	Transmit and Receive 64 Octet Frames Register
01C8 026C	FRAME65T127	Transmit and Receive 65 to 127 Octet Frames Register
01C8 0270	FRAME128T255	Transmit and Receive 128 to 255 Octet Frames Register
01C8 0274	FRAME256T511	Transmit and Receive 256 to 511 Octet Frames Register
01C8 0278	FRAME512T1023	Transmit and Receive 512 to 1023 Octet Frames Register
01C8 027C	FRAME1024TUP	Transmit and Receive 1024 to 1518 Octet Frames Register
01C8 0280	NETOCTETS	Network Octet Frames Register
01C8 0284	RXSOFOVERRUNS	Receive FIFO or DMA Start of Frame Overruns Register
01C8 0288	RXMOFOVERRUNS	Receive FIFO or DMA Middle of Frame Overruns Register
01C8 028C	RXDMAOVERRUNS	Receive DMA Start of Frame and Middle of Frame Overruns Register

			MIN	MAX	
1	$t_{d(MTCLKH-MTXD)}$	Delay time, MTCLK high to transmit selected signals valid	2	25	ns

(1) Transmit selected signals include: MTXD3-MTXD0, and MTXEN.

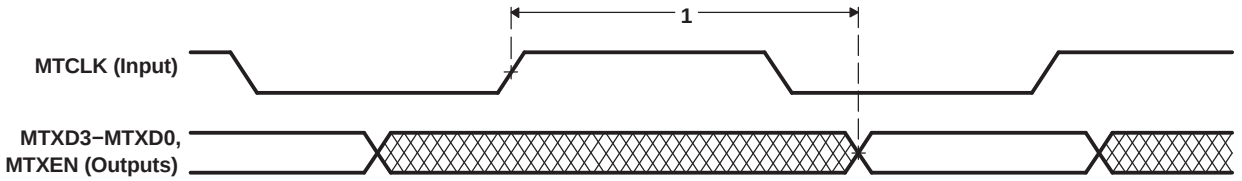

Figure 6-42. EMAC Transmit Interface Timing

6.17 Management Data Input/Output (MDIO)

The Management Data Input/Output (MDIO) module continuously polls all 32 MDIO addresses in order to enumerate all PHY devices in the system.

The Management Data Input/Output (MDIO) module implements the 802.3 serial management interface to interrogate and control Ethernet PHY(s) using a shared two-wire bus. Host software uses the MDIO module to configure the auto-negotiation parameters of each PHY attached to the EMAC, retrieve the negotiation results, and configure required parameters in the EMAC module for correct operation. The module is designed to allow almost transparent operation of the MDIO interface, with very little maintenance from the core processor. Only one PHY may be connected at any given time.

For more detailed information on the MDIO peripheral, see the *Documentation Support* section for the Ethernet Media Access Controller (EMAC)/Management Data Input/Output (MDIO) Module Reference Guide. For a list of supported registers and register fields, see Table 6-73 [MDIO Registers] in this data manual.

6.17.1 Peripheral Register Description(s)

Table 6-73. MDIO Registers

HEX ADDRESS RANGE	ACRONYM	REGISTER NAME
0x01C8 4000	–	Reserved
0x01C8 4004	CONTROL	MDIO Control Register
0x01C8 4008	ALIVE	MDIO PHY Alive Status Register
0x01C8 400C	LINK	MDIO PHY Link Status Register
0x01C8 4010	LINKINTRAW	MDIO Link Status Change Interrupt (Unmasked) Register
0x01C8 4014	LINKINTMASKED	MDIO Link Status Change Interrupt (Masked) Register
0x01C8 4018	–	Reserved
0x01C8 4020	USERINTRAW	MDIO User Command Complete Interrupt (Unmasked) Register
0x01C8 4024	USERINTMASKED	MDIO User Command Complete Interrupt (Masked) Register
0x01C8 4028	USERINTMASKSET	MDIO User Command Complete Interrupt Mask Set Register
0x01C8 402C	USERINTMASKCLEAR	MDIO User Command Complete Interrupt Mask Clear Register
0x01C8 4030 - 0x01C8 407C	–	Reserved
0x01C8 4080	USERACCESS0	MDIO User Access Register 0
0x01C8 4084	USERPHYSEL0	MDIO User PHY Select Register 0
0x01C8 4088	USERACCESS1	MDIO User Access Register 1
0x01C8 408C	USERPHYSEL1	MDIO User PHY Select Register 1
0x01C8 4090 - 0x01C8 47FF	–	Reserved

6.17.2 Management Data Input/Output (MDIO) Electrical Data/Timing

Table 6-74. Timing Requirements for MDIO Input (see Figure 6-43 and Figure 6-44)

NO.			-7/-6/-5/-4 -L/-Q6/-Q5/-Q4		UNIT
			MIN	MAX	
1	$t_{c(MDCLK)}$	Cycle time, MDCLK	400		ns
2	$t_{w(MDCLK)}$	Pulse duration, MDCLK high/low	180		ns
3	$t_{t(MDCLK)}$	Transition time, MDCLK		5	ns
4	$t_{su(MDIO-MDCLKH)}$	Setup time, MDIO data input valid before MDCLK high	10		ns
5	$t_{h(MDCLKH-MDIO)}$	Hold time, MDIO data input valid after MDCLK high	10		ns

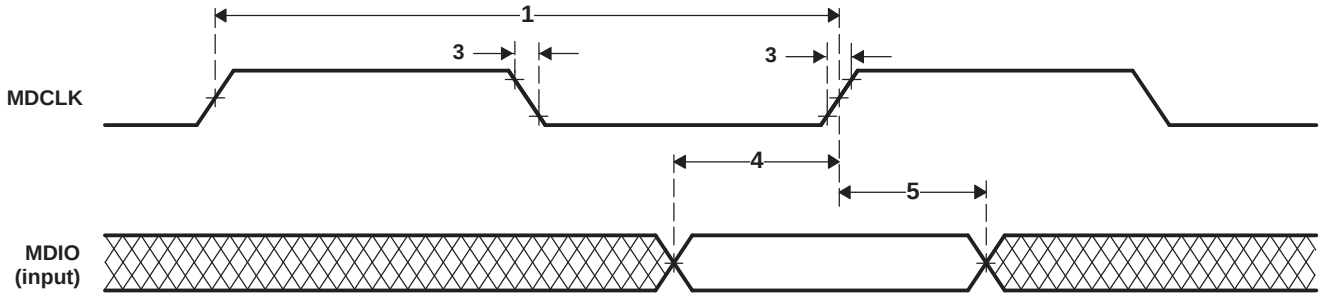

Figure 6-43. MDIO Input Timing

			MIN	MAX	
7	$t_{d(MDCLKL-MDIO)}$	Delay time, MDCLK low to MDIO data output valid		100	ns

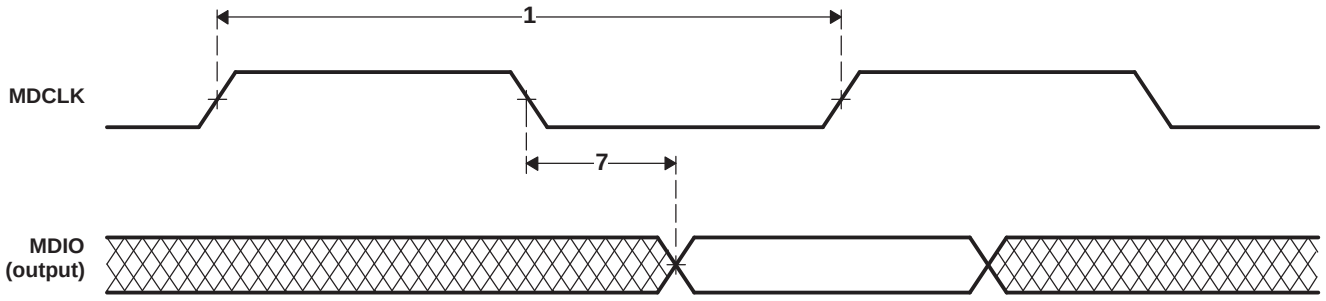

Figure 6-44. MDIO Output Timing

6.18 Timers

The DM6433 device has 3 64-bit general-purpose timers which have the following features:

- 64-bit count-up counter
- Timer modes:
  - 64-bit general-purpose timer mode (Timer 0 and 1)
  - Dual 32-bit general-purpose timer mode (Timer 0 and 1)
  - Watchdog timer mode (Timer 2)
- 2 possible clock sources:

  - Internal clock
  - External clock input via timer input pin TINPL (Timer 0 and 1 only)
- 2 operation modes:
  - One-time operation (timer runs for one period then stops)
  - Continuous operation (timer automatically resets after each period)
- Generates interrupts to the DSP
- Generates sync event to EDMA
- Causes device global reset upon watchdog timer timeout (Timer 2 only)

For more detailed information, see Section 2.9, *Documentation Support* for the *TMS320DM643x DMP 64-Bit Timer* User's Guide (literature number SPRU989).

6.18.1 Timer Peripheral Register Description(s)

0x01C2 1C24	TGCR	Timer 2 Global Control Register
0x01C2 1C28	WDTCR	Timer 2 Watchdog Timer Control Register

Table 6-78. Timer 2 (Watchdog) Registers (continued)

HEX ADDRESS RANGE	ACRONYM	DESCRIPTION
0x01C2 1C2C - 0x01C2 1FFF	-	Reserved

6.18.2 Timer Electrical Data/Timing

Table 6-79. Timing Requirements for Timer Input(1)(2)(3) (see Figure 6-45)

NO.			-7/-6/-5/-4 -L/-Q6/-Q5/-Q4		UNIT
			MIN	MAX	
1	$t_{w(TINPH)}$ Pulse duration, TINPxL high	TINP0L, if TIMERCTL.TINP0SEL = 0 [default]	2P		ns
		TINP0L, if TIMERCTL.TINP0SEL = 1	0.33P		ns
		TINP1L	2P		ns
2	$t_{w(TINPL)}$ Pulse duration, TINPxL low	TINP0L, if TIMERCTL.TINP0SEL = 0 [default]	2P		ns
		TINP0L, if TIMERCTL.TINP0SEL = 1	0.33P		ns
		TINP1L	2P		ns

(1) P = MXI/CLKIN cycle time in ns. For example, when MXI/CLKIN frequency is 27 MHz, use P = 37.0$\overline{37}$ ns.
(2) The TIMERCTL.TINP0SEL field in the System Module determines if the TINP0L input directly goes to Timer 0 (TIMERCTL.TINP0SEL=0), or if the TINP0L input is first divided down by 6 before going to Timer 0 (TIMERCTL.TINP0SEL=1).
(3) TINP1L input goes directly to Timer 1.

Table 6-80. Switching Characteristics Over Recommended Operating Conditions for Timer Output(1) (see Figure 6-45)

NO.			-7/-6/-5/-4 -L/-Q6/-Q5/-Q4		UNIT
			MIN	MAX	
3	$t_{w(TOUTH)}$	Pulse duration, TOUTxL high	P		ns
4	$t_{w(TOUTL)}$	Pulse duration, TOUTxL low	P		ns

(1) P = MXI/CLKIN cycle time in ns. For example, when MXI/CLKIN frequency is 27 MHz, use P = 37.0$\overline{37}$ ns.

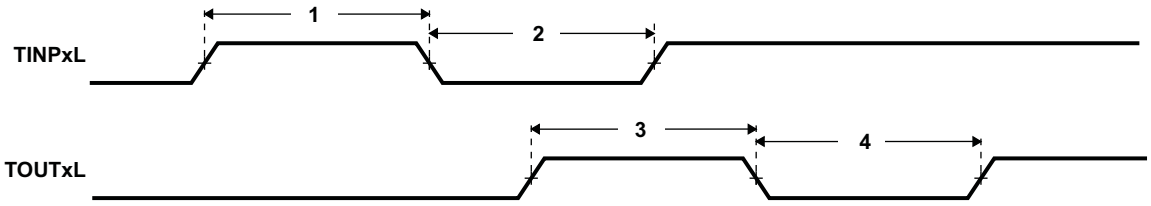

Figure 6-45. Timer Timing

6.19 Peripheral Component Interconnect (PCI)

The DM6433 DMP supports connections to PCI-compliant devices via the integrated PCI master/slave bus interface. The PCI port interfaces to DSP internal resources via the data switched central resource. The data switched central resource is described in more detail in Section 4, *System Interconnect*.

For more detailed information on the PCI port peripheral module, see the *TMS320DM643x DMP Peripheral Component Interconnect (PCI)* User's Guide (literature number SPRU985).

6.19.1 PCI Device-Specific Information

The PCI peripheral can act both as a PCI bus master and as a target. It supports PCI bus operation of speeds up to 33 MHz and uses a 32-bit data/address bus.

On the DM6433 device, the pins of the PCI peripheral are multiplexed with the pins of the VPSS, EMIFA, GPIO, HPI, VLYNQ, and EMAC peripherals. For more detailed information on how to select PCI, see Section 3, Device Configurations.

The DM6433 device provides an initialization mechanism through which the default values for some of the PCI configuration registers can be read from an I2C EEPROM. Table 6-81 shows the registers which can be initialized through the PCI auto-initialization. The default value of these registers when PCI auto-initialization is **not** used is also shown in Table 6-81. PCI auto-initialization is enabled by selecting PCI boot with auto-initialization. For information on how to select PCI boot with auto-initialization, see Section 3.4.1, Boot Modes. For more information on PCI auto-initialization, see the *TMS320DM643x DMP Peripheral Component Interconnect (PCI)* User's Guide (literature number SPRU985) and the *Using the TMS320DM643x Bootloader* Application Report (literature number SPRAAG0).

The PCI peripheral is a master peripheral within the DM6433 DMP.

Table 6-81. Default Values for PCI Configuration Registers

REGISTER	DEFAULT VALUE (HEX)
Vendor ID	104C
Device ID	B001

6.19.3 PCI Electrical Data/Timing

Texas Instruments (TI) has performed the simulation and system characterization to ensure that the PCI peripheral meets all AC timing specifications as required by the *PCI Local Bus Specification Revision 2.3*. Therefore, the AC timing specifications are **not** reproduced here. For more information on the AC timing specifications, see Section 4.2.3, *Timing Specification* (33-MHz timing) of the *PCI Local Bus Specification Revision 2.3*. **Note:** The DM6433 PCI peripheral **only** supports 3.3-V signaling and 33-MHz operation.

6.20 Pulse Width Modulator (PWM)

The 3 DM6433 Pulse Width Modulator (PWM) peripherals support the following features:

- Period counter
- First-phase duration counter
- Repeat count for one-shot operation
- Configurable to operate in either one-shot or continuous mode
- Buffered period and first-phase duration registers
- One-shot operation triggerable by hardware events with programmable edge transitions. (low-to-high or high-to-low).
- One-shot operation generates N+1 periods of waveform, N being the repeat count register value
- Emulation support

The register memory maps for PWM0/1/2 are shown in Table 6-85, Table 6-86, and Table 6-87.

6.21 VLYNQ

The DM6433 VLYNQ peripheral provides a high speed serial communications interface with the following features.

- Low Pin Count
- Scalable Performance / Support
- Simple Packet Based Transfer Protocol for Memory Mapped Access
  - Write Request / Data Packet
  - Read Request Packet
  - Read Response Data Packet
  - Interrupt Request Packet
- Supports both Symmetric and Asymmetric Operation
  - Tx pins on first device connect to Rx pins on second device and vice versa
  - Data pin widths are automatically detected after reset
  - Request packets, response packets, and flow control information are all multiplexed and sent across the same physical pins
  - Supports both Host/Peripheral and Peer to Peer communication
- Simple Block Code Packet Formatting (8b/10b)
- In Band Flow Control
  - No extra pins needed
  - Allows receiver to momentarily throttle back transmitter when overflow is about to occur
  - Uses built in special code capability of block code to seamlessly interleave flow control information with user data
  - Allows system designer to balance cost of data buffering versus performance
- Multiple outstanding transactions
- Automatic packet formatting optimizations
- Internal loop-back mode

Table 6-93. Timing Requirements for Receive Data for the VLYNQ Module(1) (see Figure 6-48)

NO.				-7/-6/-5/-4 -L/-Q6/-Q5/-Q4		UNIT
				MIN	MAX	
3	$t_{su(RXDV-VCLKH)}$	Setup time, VLYNQ_RXD[3:0] valid before VLYNQ_CLK high	RTM disabled, RTM sample = 3	1.75		ns
			RTM enabled	(1)		ns
4	$t_{h(VCLKH-RXDV)}$	Hold time, VLYNQ_RXD[3:0] valid after VLYNQ_CLK high	RTM disabled, RTM sample = 3	3		ns
			RTM enabled	(1)		ns

(1) The VLYNQ receive timing manager (RTM) is a serial receive logic designed to eliminate setup and hold violations that could occur in traditional input signals. RTM logic automatically selects the setup and hold timing from one of eight data flops (see Table 6-94). When RTM logic is disabled, the setup and hold timing from the default data flop (3) is used.

Table 6-94. RTM RX Data Flop Hold/Setup Timing Constraints (Typical Values)

RX Data Flop	HOLD (Y)	SETUP (X)
0	1.3	0.9
1	1.4	0.7
2	1.5	-0.4
3	1.6	-0.6
4	1.8	-0.8
5	2.0	-1.0
6	2.2	-1.1
7	2.4	-1.2

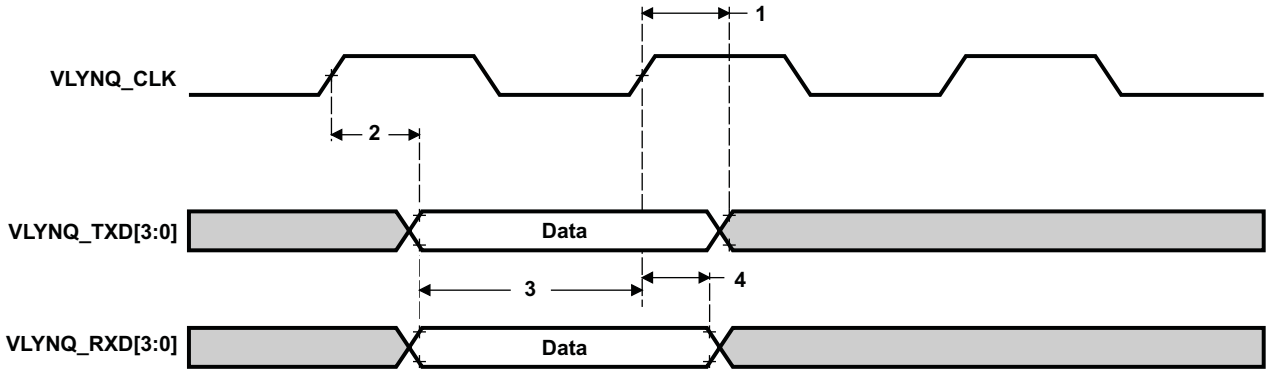

Figure 6-48. VLYNQ Transmit/Receive Timing

6.22 General-Purpose Input/Output (GPIO)

The GPIO peripheral provides general-purpose pins that can be configured as either inputs or outputs. When configured as an output, a write to an internal register can control the state driven on the output pin. When configured as an input, the state of the input is detectable by reading the state of an internal register. In addition, the GPIO peripheral can produce CPU interrupts and EDMA events in different interrupt/event generation modes. The GPIO peripheral provides generic connections to external devices. The GPIO pins are grouped into banks of 16 pins per bank (i.e., bank 0 consists of GP[0:15]).

The DM6433 GPIO peripheral supports the following:

- Up to 111 3.3-V GPIO pins, GP[0:110]
- Interrupts:
  - Up to 8 unique GP[0:7] interrupts from Bank 0
  - 7 GPIO bank (aggregated) interrupt signals from each of the 7 banks of GPIOs
  - Interrupts can be triggered by rising and/or falling edge, specified for each interrupt capable GPIO signal
- DMA events:
  - Up to 8 unique GPIO DMA events from Bank 0
  - 7 GPIO bank (aggregated) DMA event signals from each of the 7 banks of GPIOs
- Set/clear functionality: Firmware writes 1 to corresponding bit position(s) to set or to clear GPIO signal(s). This allows multiple firmware processes to toggle GPIO output signals without critical section protection (disable interrupts, program GPIO, re-enable interrupts, to prevent context switching to anther process during GPIO programming).
- Separate Input/Output registers
- Output register in addition to set/clear so that, if preferred by firmware, some GPIO output signals can be toggled by direct write to the output register(s).
- Output register, when read, reflects output drive status. This, in addition to the input register reflecting pin status and open-drain I/O cell, allows wired logic be implemented.

The memory map for the GPIO registers is shown in Table 6-95. For more detailed information on GPIOs, see the *TMS320DM643x DMP General-Purpose Input/Output (GPIO)* User's Guide (literature number SPRU988).

6.22.2 GPIO Peripheral Input/Output Electrical Data/Timing

Table 6-96. Timing Requirements for GPIO Inputs[1] (see Figure 6-49)

NO.			-7/-6/-5/-4 -L/-Q6/-Q5/-Q4		UNIT
			MIN	MAX	
1	$t_{w(GPIH)}$	Pulse duration, GP[x] input high	2C[2]		ns
2	$t_{w(GPIL)}$	Pulse duration, GP[x] input low	2C[2]		ns

(1) The pulse width given is sufficient to generate a CPU interrupt or an EDMA event. However, if a user wants to have DM6433 recognize the GP[x] input changes through software polling of the GPIO register, the GP[x] input duration must be extended to allow DM6433 enough time to access the GPIO register through the internal bus.
(2) C = SYSCLK3 period in ns. For example, when running parts at 600 MHz, use C = 10ns.

Table 6-97. Switching Characteristics Over Recommended Operating Conditions for GPIO Outputs (see Figure 6-49)

NO.	PARAMETER		-7/-6/-5/-4 -L/-Q6/-Q5/-Q4		UNIT
			MIN	MAX	
3	$t_{w(GPOH)}$	Pulse duration, GP[x] output high	2C[1][2]		ns
4	$t_{w(GPOL)}$	Pulse duration, GP[x] output low	2C[1][2]		ns

(1) This parameter value should not be used as a maximum performance specification. Actual performance of back-to-back accesses of the GPIO is dependent upon internal bus activity.
(2) C = SYSCLK3 period in ns. For example, when running parts at 600 MHz, use C = 10ns.

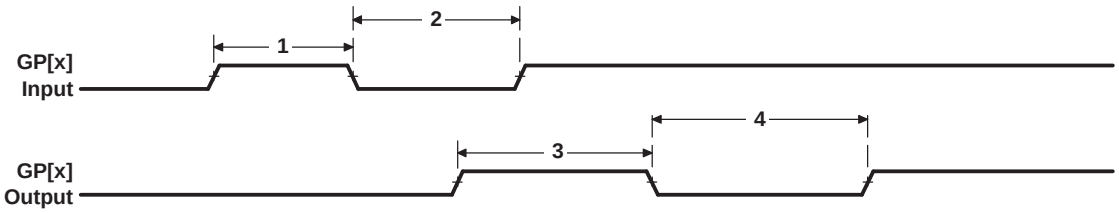

Figure 6-49. GPIO Port Timing

6.23 IEEE 1149.1 JTAG

The JTAG[3] interface is used for BSDL testing and emulation of the DM6433 device.

$\overline{\text{TRST}}$ only needs to be released when it is necessary to use a JTAG controller to debug the device or exercise the device's boundary scan functionality. **Note:** $\overline{\text{TRST}}$ is synchronous and ***must*** be clocked by TCK; otherwise, the boundary scan logic may not respond as expected after $\overline{\text{TRST}}$ is asserted.

For maximum reliability, DM6433 includes an internal pulldown (IPD) on the $\overline{\text{TRST}}$ pin to ensure that $\overline{\text{TRST}}$ will always be asserted upon power up and the device's internal emulation logic will always be properly initialized.

JTAG controllers from Texas Instruments actively drive $\overline{\text{TRST}}$ high. However, some third-party JTAG controllers may not drive $\overline{\text{TRST}}$ high but expect the use of a pullup resistor on $\overline{\text{TRST}}$.

When using this type of JTAG controller, assert $\overline{\text{TRST}}$ to initialize the device after powerup and externally drive $\overline{\text{TRST}}$ high before attempting any emulation or boundary scan operations.

6.23.1 JTAG ID (JTAGID) Register Description(s)

(3) IEEE Standard 1149.1-1990 Standard-Test-Access Port and Boundary Scan Architecture.

Table 6-98. JTAG ID (JTAGID) Register

HEX ADDRESS RANGE	ACRONYM	REGISTER NAME	COMMENTS
0x01C4 0028	JTAGID	JTAG Identification Register	Read-only. Provides 32-bit JTAG ID of the device.

The JTAG ID register is a read-only register that identifies to the customer the JTAG/Device ID. For the DM6433 device, the JTAG ID register resides at address location 0x01C4 0028. For the actual register bit names and their associated bit field descriptions, see Figure 6-50 and Table 6-99.

R-n	R-1011 0111 0010 0001	R-0000 0010 111	R-1

LEGEND: R = Read, W = Write, n = value at reset

Figure 6-50. JTAG ID (JTAGID) Register—0x01C4 0028

Table 6-99. JTAG ID (JTAGID) Register Selection Bit Descriptions

BIT	NAME	DESCRIPTION
31:28	VARIANT	Variant (4-Bit) value. A read from this field always returns 0b0000.
27:12	PART NUMBER	Part Number (16-Bit) value. DM6433 value: 1011 0111 0010 0001.
11-1	MANUFACTURER	Manufacturer (11-Bit) value. DM6433 value: 0000 0010 111.
0	LSB	LSB. This bit is read as a "1" for DM6433.

6.23.2 JTAG Electrical Data/Timing

Table 6-100. Timing Requirements for JTAG Test Port (see Figure 6-51)

NO.			-7/-6/-5/-4 -L/-Q6/-Q5/-Q4		UNIT
			MIN	MAX	
1	$t_{c(TCK)}$	Cycle time, TCK	33		ns
3	$t_{su(TDIV-TCKH)}$	Setup time, TDI/TMS/$\overline{TRST}$ valid before TCK high	2.5		ns
4	$t_{h(TCKH-TDIV)}$	Hold time, TDI/TMS/$\overline{TRST}$ valid after TCK high	16.5		ns

Table 6-101. Switching Characteristics Over Recommended Operating Conditions for JTAG Test Port (see Figure 6-51)

NO.	PARAMETER		-7/-6/-5/-4 -L/-Q6/-Q5/-Q4		UNIT
			MIN	MAX	
2	$t_{d(TCKL-TDOV)}$	Delay time, TCK low to TDO valid	0	14	ns

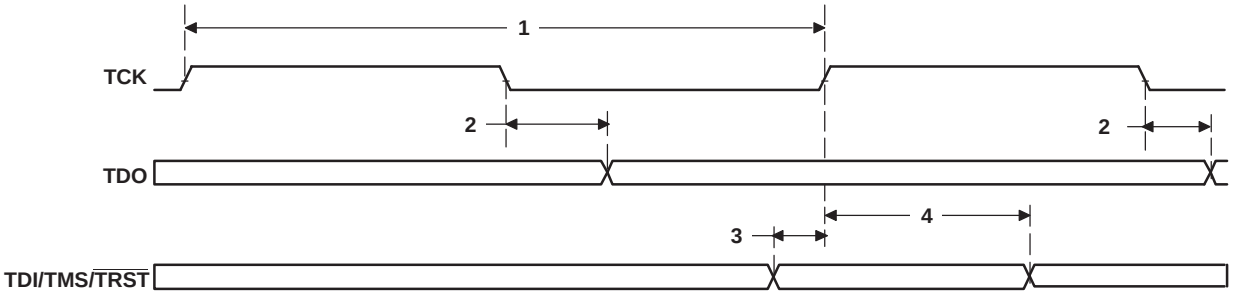

Figure 6-51. JTAG Test-Port Timing

7 Mechanical Data

The following table(s) show the thermal resistance characteristics for the PBGA–ZWT and ZDU mechanical package(s). For more details, see the *Thermal Considerations for TMS320DM64xx, TMS320DM64x, and TMS320C6000 Devices* Application Report (literature number SPRAAL9).

7.1 Thermal Data for ZWT

Table 7-1. Thermal Resistance Characteristics (PBGA Package) [ZWT]

NO.			°C/W(1)	AIR FLOW (m/s)(2)
1	$R\Theta_{JC}$	Junction-to-case	5.4	N/A
2	$R\Theta_{JB}$	Junction-to-board	16.0	N/A
3	$R\Theta_{JA}$	Junction-to-free air	26.6	0.00
4			21.9	1.0
5			20.4	2.00
7	Psi_{JT}	Junction-to-package top	0.0	0.00
8			0.1	1.0
9			0.2	2.00
11	Psi_{JB}	Junction-to-board	15.9	0.00
12			15.8	1.0
13			15.3	2.00

(1) The junction-to-case measurement was conducted in a JEDEC defined 1S0P system. Other measurements were conducted in a JEDEC defined 1S2P system and will change based on environment as well as application.
For more information, see these three EIA/JEDEC standards:

- EIA/JESD51-2, *Integrated Circuits Thermal Test Method Environment Conditions - Natural Convection (Still Air)*
- EIA/JESD51-3, *Low Effective Thermal Conductivity Test Board for Leaded Surface Mount Packages*
- JESD51-7, *High Effective Thermal Conductivity Test Board for Leaded Surface Mount Packages*

.

(2) m/s = meters per second

7.1.1 Thermal Data for ZDU

Table 7-2. Thermal Resistance Characteristics (PBGA Package) [ZDU]

NO.			°C/W(1)	AIR FLOW (m/s)(2)
1	$R\Theta_{JC}$	Junction-to-case	7.7	N/A
2	$R\Theta_{JB}$	Junction-to-board	10.5	N/A
3	$R\Theta_{JA}$	Junction-to-free air	19.7	0.00
4			15.5	1.0
5			14.3	2.00
7	Psi_{JT}	Junction-to-package top	4.9	0.00
8			5.1	1.0
9			5.2	2.00
11	Psi_{JB}	Junction-to-board	10.4	0.00
12			9.8	1.0
13			9.6	2.00

(1) The junction-to-case measurement was conducted in a JEDEC defined 1S0P system. Other measurements were conducted in a JEDEC defined 1S2P system and will change based on environment as well as application.
For more information, see these three EIA/JEDEC standards:
- EIA/JESD51-2, *Integrated Circuits Thermal Test Method Environment Conditions - Natural Convection (Still Air)*
- EIA/JESD51-3, *Low Effective Thermal Conductivity Test Board for Leaded Surface Mount Packages*
- JESD51-7, *High Effective Thermal Conductivity Test Board for Leaded Surface Mount Packages*

(2) m/s = meters per second

7.1.2 Packaging Information

The following packaging information and addendum reflect the most current data available for the designated device(s). This data is subject to change without notice and without revision of this document.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/ Ball Finish	MSL Peak Temp (3)	Samples (Requires Login)
TMS320DM6433ZDU4	ACTIVE	BGA	ZDU	376	60	Green (RoHS & no Sb/Br)	Call TI	Level-3-260C-168 HR	
TMS320DM6433ZDU6	ACTIVE	BGA	ZDU	376	60	Green (RoHS & no Sb/Br)	Call TI	Level-3-260C-168 HR

TMS320DM6433ZWTQ6	ACTIVE	NFBGA	ZWT	361	90	Pb-Free (RoHS)	SNAGCU	Level-3-260C-168 HR	

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

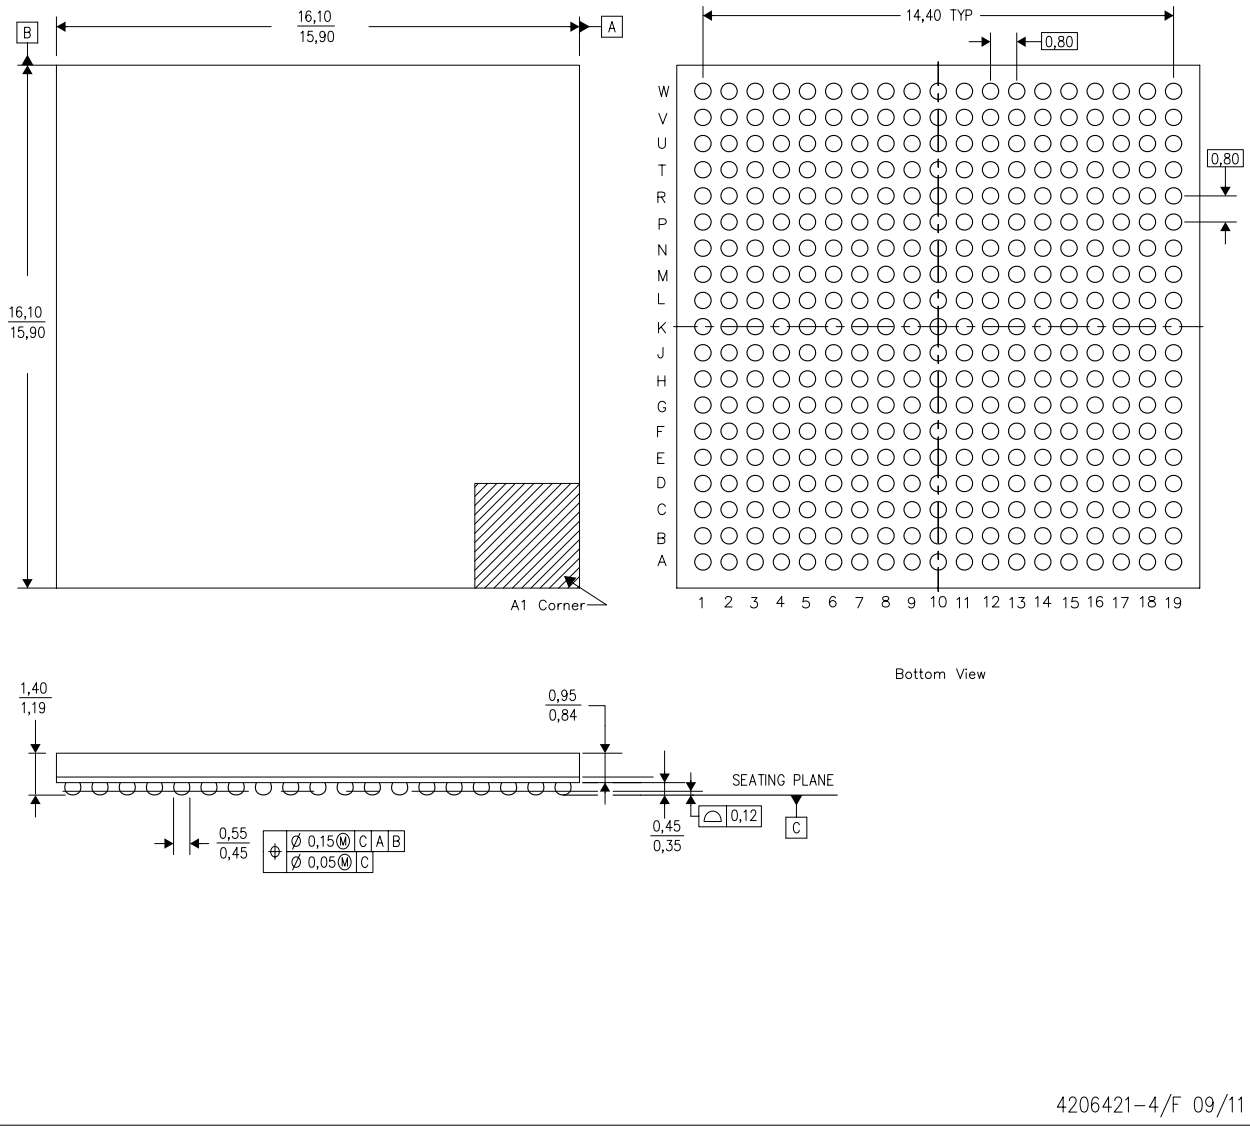
(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The Pb-Free/Green conversion plan has not been defined.
Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.
Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

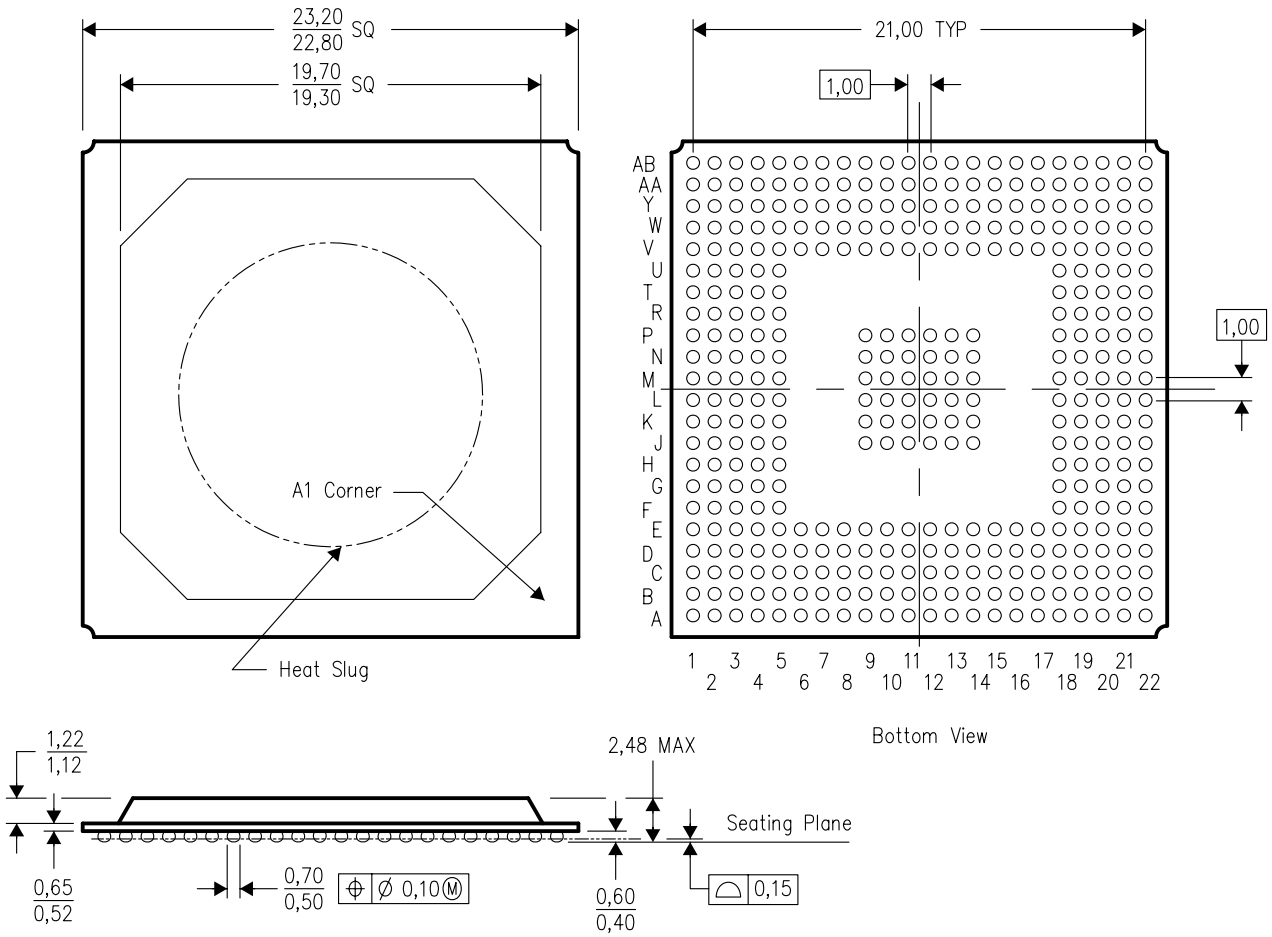
In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

ZWT (S–PBGA–N361) PLASTIC BALL GRID ARRAY



NOTES:
A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M–1994.
B. This drawing is subject to change without notice.
C. This is a Pb–free solder ball design.
D. Falls within JEDEC MO–275.

ZDU (S–PBGA–N376) PLASTIC BALL GRID ARRAY



NOTES:
A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Falls within JEDEC MO–151
D. Thermally enhanced molded plastic package with heat slug (HSL).
E. This is a lead–free solder ball design.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as “components”) are sold subject to TI’s terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI’s terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers’ products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers’ products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI’s goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or “enhanced plastic” are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have ***not*** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components which meet ISO/TS16949 requirements, mainly for automotive use. Components which have not been so designated are neither designed nor intended for automotive use; and TI will not be responsible for any failure of such components to meet such requirements.

Стандарт Электрон Связь

Мы молодая и активно развивающаяся компания в области поставок электронных компонентов. Мы поставляем электронные компоненты отечественного и импортного производства напрямую от производителей и с крупнейших складов мира.

Благодаря сотрудничеству с мировыми поставщиками мы осуществляем комплексные и плановые поставки широчайшего спектра электронных компонентов.

Собственная эффективная логистика и склад в обеспечивает надежную поставку продукции в точно указанные сроки по всей России.

Мы осуществляем техническую поддержку нашим клиентам и предпродажную проверку качества продукции. На все поставляемые продукты мы предоставляем гарантию .

Осуществляем поставки продукции под контролем ВП МО РФ на предприятия военно-промышленного комплекса России , а также работаем в рамках 275 ФЗ с открытием отдельных счетов в уполномоченном банке. Система менеджмента качества компании соответствует требованиям ГОСТ ISO 9001.

Минимальные сроки поставки, гибкие цены, неограниченный ассортимент и индивидуальный подход к клиентам являются основой для выстраивания долгосрочного и эффективного сотрудничества с предприятиями радиоэлектронной промышленности, предприятиями ВПК и научно-исследовательскими институтами России.

С нами вы становитесь еще успешнее!
