General Description

The HMC865LC3C is a Limiting Amplifier packaged in a leadless 3x3 mm ceramic surface mount package which supports up to 43 Gbps operation. The amplifier provides 30 dB of differential gain. Output voltage swing is adjustable up to 800 mVp-p differential by using the VAC analog control input. Additive rms jitter is less than 300 fs for 32 Gbps operation. HMC865LC3C has an internal DC offset correction circuit which provides differential 10 mVpp input sensitivity.

All input/output RF signals of the HMC865LC3C are terminated with 50 Ohms to +3.3V on chip and may be either AC or DC coupled. The outputs of the device can be operated either differentially or single-ended. Outputs can be connected directly to 50 Ohm terminated system referenced to 3.3V, while DC blocking capacitors may be used if the terminating system is 50 Ohms to a non 3.3V level.

Electrical Specifications, $T_A = +25^\circ C$, $V_{cc} = +3.3V$, $V_{ee} = 0V$, $I_{cc} = 90mA$

[2] Circuit Board Material: Arlon 25FR or Rogers 4350

The circuit board used in the application should use RF circuit design techniques. Signal lines should have 50 Ohm impedance while the package ground leads and exposed paddle should be connected directly to the ground plane similar to that shown. A sufficient number of via holes should be used to connect the top and bottom ground planes. The evaluation circuit board shown is available from Hittite upon request.

Application Information

Setting the output swing using external resistor R_c

The HMC865LC3C features output swing level adjustment by using VAC pin. Output swing can be adjusted to the desired level by applying a DC voltage to VAC pin. Differential output swing vs. control voltage relationship is given in the plot below.

Differential Output vs. Control Voltage

In order to adjust the DC voltage on VAC pin a resistor, R_c , should be connected between VAC pin and VCC as shown in the figure below.

The value of the resistor can be chosen using the following equation as a function of VAC. VAC DC voltage value can be chosen by using the plot given above.

$$R_c = \frac{330(V_{CC} - V_{AC})}{V_{AC} - 0.86}$$
