Octal D-type flip-flop; positive-edge trigger; 3-state

Rev. 02 — 17 October 2007

Product data sheet

1. General description

The 74ALVC374 is an octal D-type flip-flop featuring separate D-type inputs for each flip-flop and 3-state outputs for bus-oriented applications. A clock input (CP) and an outputs enable input (\overline{OE}) are common to all flip-flops.

The eight flip-flops will store the state of their individual D-inputs that meet the set-up and hold times requirements on the LOW to HIGH CP transition.

When pin \overline{OE} is LOW, the contents of the eight flip-flops is available at the outputs. When pin \overline{OE} is HIGH, the outputs go to the high-impedance OFF-state. Operation of the \overline{OE} input does not affect the state of the flip-flops.

The 74ALVC374 is functionally identical to the 74ALVC574, but has a different pin arrangement.
