

## Real-Time Clock (RTC)

### Features

- Direct clock/calendar replacement for IBM® AT-compatible computers and other applications
- Functionally compatible with the DS1285
  - Closely matches MC146818A pin configuration
- 114 bytes of general nonvolatile storage
- 160ns cycle time allows fast bus operation
- Selectable Intel or Motorola bus timing
- Less than 0.5μA load under battery operation
- 14 bytes for clock/calendar and control
- BCD or binary format for clock and calendar data

- Calendar in day of the week, day of the month, months, and years, with automatic leap-year adjustment
- Time of day in seconds, minutes, and hours
  - 12- or 24-hour format
  - Optional daylight saving adjustment
- Programmable square wave output
- Three individually maskable interrupt event flags:
  - Periodic rates from 122μs to 500ms
  - Time-of-day alarm once per second to once per day
  - End-of-clock update cycle
- 24-pin plastic DIP or SOIC

### General Description

The CMOS bq3285 is a low-power microprocessor peripheral providing a time-of-day clock and 100-year calendar with alarm features and battery operation. Other features include three maskable interrupt sources, square wave output, and 114 bytes of general nonvolatile storage.

The bq3285 write-protects the clock, calendar, and storage registers during power failure. A backup battery then maintains data and operates the clock and calendar.

The bq3285 is a fully compatible real-time clock for IBM AT compatible computers and other applications. The only external components are a 32.768kHz crystal and a backup battery

### Pin Connections

### Pin Names

|         |                                       |
|---------|---------------------------------------|
| AD0-AD7 | Multiplexed address/data input/output |
| MOT     | Bus type select input                 |
| CS      | Chip select input                     |
| AS      | Address strobe input                  |
| DS      | Data strobe input                     |
| R/W     | Read/write input                      |
| INT     | Interrupt request output              |
| RST     | Reset input                           |
| SQW     | Square wave output                    |
| RCL     | RAM clear input                       |
| BC      | 3V backup cell input                  |
| X1-X2   | Crystal inputs                        |
| NC      | No connect                            |
| VCC     | +5V supply                            |
| VSS     | Ground                                |

## Block Diagram

## Pin Descriptions

**MOT** Bus type select input

MOT selects bus timing for either Motorola or Intel architecture. This pin should be tied to  $V_{CC}$  for Motorola timing or to  $V_{SS}$  for Intel timing (see Table 1). The setting should not be changed during system operation. MOT is internally pulled low by a 30K $\Omega$  resistor.

Table 1. Bus Setup

| Bus Type | MOT Level | DS Equivalent                                   | R/W Equivalent                                  | AS Equivalent |
|----------|-----------|-------------------------------------------------|-------------------------------------------------|---------------|
| Motorola | $V_{CC}$  | DS, E, or $\Phi 2$                              | $R/\overline{W}$                                | AS            |
| Intel    | $V_{SS}$  | $\overline{RD}$ , $\overline{MEMR}$ , or $I/OR$ | $\overline{WR}$ , $\overline{MEMW}$ , or $I/OW$ | ALE           |

**AD0-AD7** Multiplexed address/data input/output

The bq3285 bus cycle consists of two phases: the address phase and the data-transfer phase. The address phase precedes the data-transfer phase. During the address phase, an address placed on AD0-AD7 is latched into the bq3285 on the falling edge of the AS signal. During the data-transfer phase of the bus cycle, the AD0-AD7 pins serve as a bidirectional data bus.

**AS****Address strobe input**

AS serves to demultiplex the address/data bus. The falling edge of AS latches the address on AD0-AD7. This demultiplexing process is independent of the CS signal. For DIP and SOIC packages with MOT =  $V_{CC}$ , the AS input is provided a signal similar to ALE in an Intel-based system.

|                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>DS</b>                          | <b>Data strobe input</b> <p>When <math>MOT = V_{CC}</math>, DS controls data transfer during a bq3285 bus cycle. During a read cycle, the bq3285 drives the bus after the rising edge on DS. During a write cycle, the falling edge on DS is used to latch write data into the chip.</p> <p>When <math>MOT = V_{SS}</math>, the DS input is provided a signal similar to <math>\overline{RD}</math>, <math>\overline{MEMR}</math>, or <math>\overline{I/OR}</math> in an Intel-based system. The falling edge on DS is used to enable the outputs during a read cycle.</p>            | <b><math>\overline{RCL}</math></b> | <b>RAM clear input</b> <p>A low level on the <math>\overline{RCL}</math> pin causes the contents of each of the 114 storage bytes to be set to FF(hex). The contents of the clock and control registers are unaffected. This pin should be used as a user-interface input (pushbutton to ground) and not connected to the output of any active component. <math>\overline{RCL}</math> input is only recognized when held low for at least 125ms in the presence of <math>V_{CC}</math> when the oscillator is running. Using RAM clear does not affect the battery load. This pin is connected internally to a 30K<math>\Omega</math> pull-up resistor.</p> |
| <b><math>R/\overline{W}</math></b> | <b>Read/write input</b> <p>When <math>MOT = V_{CC}</math>, the level on <math>R/\overline{W}</math> identifies the direction of data transfer. A high level on <math>R/\overline{W}</math> indicates a read bus cycle, whereas a low on this pin indicates a write bus cycle.</p> <p>When <math>MOT = V_{SS}</math>, <math>R/\overline{W}</math> is provided a signal similar to <math>\overline{WR}</math>, <math>\overline{MEMW}</math>, or <math>\overline{I/OW}</math> in an Intel-based system. The rising edge on <math>R/\overline{W}</math> latches data into the bq3285.</p> | <b>BC</b>                          | <b>3V backup cell input</b> <p>BC should be connected to a 3V backup cell for RTC operation and storage register non-volatility in the absence of power. When <math>V_{CC}</math> slews down past <math>V_{BC}</math> (3V typical), the integral control circuitry switches the power source to BC. When <math>V_{CC}</math> returns above <math>V_{BC}</math>, the power source is switched to <math>V_{CC}</math>.</p> <p>Upon power-up, a voltage within the <math>V_{BC}</math> range must be present on the BC pin for the oscillator to start up.</p>                                                                                                 |
| <b><math>\overline{CS}</math></b>  | <b>Chip select input</b> <p><math>\overline{CS}</math> should be driven low and held stable during the data-transfer phase of a bus cycle accessing the bq3285.</p>                                                                                                                                                                                                                                                                                                                                                                                                                   | <b><math>\overline{RST}</math></b> | <b>Reset input</b> <p>The bq3285 is reset when <math>\overline{RST}</math> is pulled low. When reset, <math>\overline{INT}</math> becomes high-impedance, and the bq3285 is not accessible. Table 4 in the Control/Status Registers section lists the register bits that are cleared by a reset.</p> <p>Reset may be disabled by connecting <math>\overline{RST}</math> to <math>V_{CC}</math>. This allows the control bits to retain their states through power-down/power-up cycles.</p>                                                                                                                                                                 |
| <b><math>\overline{INT}</math></b> | <b>Interrupt request output</b> <p><math>\overline{INT}</math> is an open-drain output. <math>\overline{INT}</math> is asserted low when any event flag is set and the corresponding event enable bit is also set. <math>\overline{INT}</math> becomes high-impedance whenever register C is read (see the Control/Status Registers section).</p>                                                                                                                                                                                                                                     | <b>X1-X2</b>                       | <b>Crystal inputs</b> <p>The X1-X2 inputs are provided for an external 32.768KHz quartz crystal, Daiwa DT-26 or equivalent, with 6pF load capacitance. A trimming capacitor may be necessary for extremely precise time-base generation.</p> <p>In the absence of a crystal, an oscillated output of 32.768kHz can be fed into the X1 input.</p>                                                                                                                                                                                                                                                                                                            |
| <b>SQW</b>                         | <b>Square-wave output</b> <p>SQW may output a programmable frequency square-wave signal during normal (<math>V_{CC}</math> valid) system operation. Any one of the 13 specific frequencies may be selected through register A. This pin is held low when the square-wave enable bit (SQWE) in register B is 0 (see the Control/Status Registers section).</p>                                                                                                                                                                                                                         |                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

bq3285

Functional Description

Address Map

The bq3285 provides 14 bytes of clock and control/status registers and 114 bytes of general nonvolatile storage. Figure 1 illustrates the address map for the bq3285.

Update Period

The update period for the bq3285 is one second. The bq3285 updates the contents of the clock and calendar locations during the update cycle at the end of each up-

date period (see Figure 2). The alarm flag bit may also be set during the update cycle.

The bq3285 copies the local register updates into the user buffer accessed by the host processor. When a 1 is written to the update transfer inhibit bit (UTI) in register B, the user copy of the clock and calendar bytes remains unchanged, while the local copy of the same bytes continues to be updated every second.

The update-in-progress bit (UIP) in register A is set  $t_{BUC}$  time before the beginning of an update cycle (see Figure 2). This bit is cleared and the update-complete flag (UF) is set at the end of the update cycle.

Figure 1. Address Map

Figure 2. Update Period Timing and UIP

## Programming the RTC

The time-of-day, alarm, and calendar bytes can be written in either the BCD or binary format (see Table 2).

These steps may be followed to program the time, alarm, and calendar:

1. Modify the contents of register B:
  - a. Write a 1 to the UTI bit to prevent transfers between RTC bytes and user buffer.
  - b. Write the appropriate value to the data format (DF) bit to select BCD or binary format for all time, alarm, and calendar bytes.
2. Write new values to all the time, alarm, and calendar locations.
3. Clear the UTI bit to allow update transfers.

On the next update cycle, the RTC updates all 10 bytes in the selected format.

**Table 2. Time, Alarm, and Calendar Formats**

| Address | RTC Bytes                   | Range   |                           |                           |
|---------|-----------------------------|---------|---------------------------|---------------------------|
|         |                             | Decimal | Binary                    | Binary-Coded Decimal      |

## bq3285

### Square-Wave Output

The bq3285 divides the 32.768kHz oscillator frequency to produce the 1Hz update frequency for the clock and calendar. Thirteen taps from the frequency divider are fed to a 16:1 multiplexer circuit. The output of this mux is fed to the SQW output and periodic interrupt generation circuitry. The four least-significant bits of register A, RS0–RS3, select among the 13 taps (see Table 3). The square-wave output is enabled by writing a 1 to the square-wave enable bit (SQWE) in register B.

### Interrupts

The bq3285 allows three individually selected interrupt events to generate an interrupt request. These three interrupt events are:

- The periodic interrupt, programmable to occur once every 122 $\mu$ s to 500ms
- The alarm interrupt, programmable to occur once per second to once per day

- The update-ended interrupt, which occurs at the end of each update cycle

Each of the three interrupt events is enabled by an individual interrupt-enable bit in register B. When an event occurs, its event flag bit in register C is set. If the corresponding event enable bit is also set, then an interrupt request is generated. The interrupt request flag bit (INTF) of register C is set with every interrupt request. Reading register C clears all flag bits, including INTF, and makes INT high-impedance.

Two methods can be used to process bq3285 interrupt events:

- Enable interrupt events and use the interrupt request output to invoke an interrupt service routine.
- Do not enable the interrupts and use a polling routine to periodically check the status of the flag bits.

The individual interrupt sources are described in detail in the following sections.

**Table 3. Square-Wave Frequency/Periodic Interrupt Rate**

| Register A Bits |     |     |     | Square Wave |       | Periodic Interrupt |         |
|-----------------|-----|-----|-----|-------------|-------|--------------------|---------|
| RS3             | RS2 | RS1 | RS0 | Frequency   | Units | Period             | Units   |
| 0               | 0   | 0   | 0   | None        |       | None               |         |
| 0               | 0   | 0   | 1   | 256         | Hz    | 3.90625            | ms      |
| 0               | 0   | 1   | 0   | 128         | Hz    | 7.8125             | ms      |
| 0               | 0   | 1   | 1   | 8.192       | kHz   | 122.070            | $\mu$ s |
| 0               | 1   | 0   | 0   | 4.096       | kHz   | 244.141            | $\mu$ s |
| 0               | 1   | 0   | 1   | 2.048       | kHz   | 488.281            | $\mu$ s |
| 0               | 1   | 1   | 0   | 1.024       | kHz   | 976.5625           | $\mu$ s |
| 0               | 1   | 1   | 1   | 512         | Hz    | 1.95315            | ms      |
| 1               | 0   | 0   | 0   | 256         | Hz    | 3.90625            | ms      |
| 1               | 0   | 0   | 1   | 128         | Hz    | 7.8125             | ms      |
| 1               | 0   | 1   | 0   | 64          | Hz    | 15.625             | ms      |
| 1               | 0   | 1   | 1   | 32          | Hz    | 31.25              | ms      |
| 1               | 1   | 0   | 0   | 16          | Hz    | 62.5               | ms      |
| 1               | 1   | 0   | 1   | 8           | Hz    | 125                | ms      |
| 1               | 1   | 1   | 0   | 4           | Hz    | 250                | ms      |
| 1               | 1   | 1   | 1   | 2           | Hz    | 500                | ms      |

## Periodic Interrupt

The mux output used to drive the SQW output also drives the interrupt-generation circuitry. If the periodic interrupt event is enabled by writing a 1 to the periodic interrupt enable bit (PIE) in register C, an interrupt request is generated once every 122 $\mu$ s to 500ms. The period between interrupts is selected by the same bits in register A that select the square wave frequency (see Table 3).

## Alarm Interrupt

During each update cycle, the RTC compares the hours, minutes, and seconds bytes with the three corresponding alarm bytes. If a match of all bytes is found, the alarm interrupt event flag bit, AF in register C, is set to 1. If the alarm event is enabled, an interrupt request is generated.

An alarm byte may be removed from the comparison by setting it to a “don’t care” state. An alarm byte is set to a “don’t care” state by writing a 1 to each of its two most-significant bits. A “don’t care” state may be used to select the frequency of alarm interrupt events as follows:

- If none of the three alarm bytes is “don’t care,” the frequency is once per day, when hours, minutes, and seconds match.
- If only the hour alarm byte is “don’t care,” the frequency is once per hour, when minutes and seconds match.
- If only the hour and minute alarm bytes are “don’t care,” the frequency is once per minute, when seconds match.
- If the hour, minute, and second alarm bytes are “don’t care,” the frequency is once per second.

## Update Cycle Interrupt

The update cycle ended flag bit (UF) in register C is set to a 1 at the end of an update cycle. If the update interrupt enable bit (UIE) of register B is 1, and the update transfer inhibit bit (UTI) in register B is 0, then an interrupt request is generated at the end of each update cycle.

## Accessing RTC bytes

Time and calendar bytes read during an update cycle may be in error. Three methods to access the time and calendar bytes without ambiguity are:

- Enable the update interrupt event to generate interrupt requests at the end of the update cycle. The interrupt handler has a maximum of 999ms to access the clock bytes before the next update cycle begins (see Figure 3).
- Poll the update-in-progress bit (UIP) in register A. If  $UIP = 0$ , the polling routine has a minimum of  $t_{BUC}$  time to access the clock bytes (see Figure 3).
- Use the periodic interrupt event to generate interrupt requests every  $t_{PI}$  time, such that  $UIP = 1$  always occurs between the periodic interrupts. The interrupt handler has a minimum of  $t_{PI}/2 + t_{BUC}$  time to access the clock bytes (see Figure 3).

## Oscillator Control

When power is first applied to the bq3285 and  $V_{CC}$  is above  $V_{PFD}$ , the internal oscillator and frequency divider are turned on by writing a 010 pattern to bits 4 through 6 of register A. A pattern of 11X turns the oscillator on, but keeps the frequency divider disabled. Any other pattern to these bits keeps the oscillator off.

Figure 3. Update-Ended/Periodic Interrupt Relationship

# bq3285

## Power-Down/Power-Up Cycle

The bq3285 continuously monitors  $V_{CC}$  for out-of-tolerance. During a power failure, when  $V_{CC}$  falls below  $V_{PFD}$  (4.17V typical), the bq3285 write-protects the clock and storage registers. When  $V_{CC}$  is below  $V_{BC}$  (3V typical), the power source is switched to BC. RTC operation and storage data are sustained by a valid backup energy source. When  $V_{CC}$  is above  $V_{BC}$ , the power source is  $V_{CC}$ . Write-protection continues for  $t_{CSR}$  time after  $V_{CC}$  rises above  $V_{PFD}$ .

## Control/Status Registers

The four control/status registers of the bq3285 are accessible regardless of the status of the update cycle (see Table 4).

### Register A

| Register A Bits |     |     |     |     |     |     |     |
|-----------------|-----|-----|-----|-----|-----|-----|-----|
| 7               | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
| UIP             | OS2 | OS1 | OS0 | RS3 | RS2 | RS1 | RS0 |

Register A programs:

- The frequency of the square-wave and the periodic event rate.
- Oscillator operation.

Register A provides:

- Status of the update cycle.

### RS0–RS3 - Frequency Select

| 7 | 6 | 5 | 4 | 3   | 2   | 1   | 0   |
|---|---|---|---|-----|-----|-----|-----|
| - | - | - | - | RS3 | RS2 | RS1 | RS0 |

These bits select one of the 13 frequencies for the SQW output and the periodic interrupt rate, as shown in Table 3.

### OS0–OS2 - Oscillator Control

| 7 | 6   | 5   | 4   | 3 | 2 | 1 | 0 |
|---|-----|-----|-----|---|---|---|---|
| - | OS2 | OS1 | OS0 | - | - | - | - |

These three bits control the state of the oscillator and divider stages. A pattern of 010 enables RTC operation by turning on the oscillator and enabling the frequency divider. A pattern of 11X turns the oscillator on, but keeps the frequency divider disabled. When 010 is written, the RTC begins its first update after 500ms.

### UIP - Update Cycle Status

| 7   | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----|---|---|---|---|---|---|---|
| UIP | - | - | - | - | - | - | - |

This read-only bit is set prior to the update cycle. When UIP equals 1, an RTC update cycle may be in progress. UIP is cleared at the end of each update cycle. This bit is also cleared when the update transfer inhibit (UTI) bit in register B is 1.

**Table 4. Control/Status Registers**

| Reg. | Loc. (Hex) | Read | Write            | Bit Name and State on Reset |    |     |    |     |    |     |         |      |    |     |    |     |    |     |    |
|------|------------|------|------------------|-----------------------------|----|-----|----|-----|----|-----|---------|------|----|-----|----|-----|----|-----|----|
|      |            |      |                  | 7 (MSB)                     | 6  | 5   | 4  | 3   | 2  | 1   | 0 (LSB) |      |    |     |    |     |    |     |    |
| A    | 0A         | Yes  | Yes <sup>1</sup> | UIP                         | na | OS2 | na | OS1 | na | OS0 | na      | RS3  | na | RS2 | na | RS1 | na | RS0 | na |
| B    | 0B         | Yes  | Yes              | UTI                         | na | PIE | 0  | AIE | 0  | UIE | 0       | SQWE | 0  | DF  | na | HF  | na | DSE | na |
| C    | 0C         | Yes  | No               | INTF                        | 0  | PF  | 0  | AF  | 0  | UF  | 0       | -    | 0  | -   | 0  | -   | 0  | -   | 0  |
| D    | 0D         | Yes  | No               | VRT                         | na | -   | 0  | -   | 0  | -   | 0       | -    | 0  | -   | 0  | -   | 0  | -   | 0  |

- Notes:**
1. Except bit 7.
  2. na = not affected

**Register B**

| Register B Bits |     |     |     |      |    |    |     |
|-----------------|-----|-----|-----|------|----|----|-----|
| 7               | 6   | 5   | 4   | 3    | 2  | 1  | 0   |
| UTI             | PIE | AIE | UIE | SQWE | DF | HF | DSE |

Register B enables:

- Update cycle transfer operation
- Square-wave output
- Interrupt events
- Daylight saving adjustment

Register B selects:

- Clock and calendar data formats

All bits of register B are read/write.

**DSE - Daylight Saving Enable**

| 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0   |
|---|---|---|---|---|---|---|-----|
| - | - | - | - | - | - | - | DSE |

This bit enables daylight-saving time adjustments when written to 1:

- On the last Sunday in October, the first time the bq3285 increments past 1:59:59 AM, the time falls back to 1:00:00 AM.
- On the first Sunday in April, the time springs forward from 2:00:00 AM to 3:00:00 AM.

**HF - Hour Format**

| 7 | 6 | 5 | 4 | 3 | 2 | 1  | 0 |
|---|---|---|---|---|---|----|---|
| - | - | - | - | - | - | HF | - |

This bit selects the time-of-day and alarm hour format:

1 = 24-hour format

0 = 12-hour format

**DF - Data Format**

| 7 | 6 | 5 | 4 | 3 | 2  | 1 | 0 |
|---|---|---|---|---|----|---|---|
| - | - | - | - | - | DF | - | - |

This bit selects the numeric format in which the time, alarm, and calendar bytes are represented:

1 = Binary

0 = BCD

**SQWE - Square-Wave Enable**

| 7 | 6 | 5 | 4 | 3    | 2 | 1 | 0 |
|---|---|---|---|------|---|---|---|
| - | - | - | - | SQWE | - | - | - |

This bit enables the square-wave output:

1 = Enabled

0 = Disabled and held low

**UIE - Update Cycle Interrupt Enable**

| 7 | 6 | 5 | 4   | 3 | 2 | 1 | 0 |
|---|---|---|-----|---|---|---|---|
| - | - | - | UIE | - | - | - | - |

This bit enables an interrupt request due to an update ended interrupt event:

1 = Enabled

0 = Disabled

The UIE bit is automatically cleared when the UTI bit equals 1.

**AIE - Alarm Interrupt Enable**

This bit enables an interrupt request due to an alarm

| 7 | 6 | 5   | 4 | 3 | 2 | 1 | 0 |
|---|---|-----|---|---|---|---|---|
| - | - | AIE | - | - | - | - | - |

interrupt event:

1 = Enabled

0 = Disabled

**PIE - Periodic Interrupt Enable**

This bit enables an interrupt request due to a periodic

| 7 | 6   | 5 | 4 | 3 | 2 | 1 | 0 |
|---|-----|---|---|---|---|---|---|
| - | PIE | - | - | - | - | - | - |

interrupt event:

1 = Enabled

0 = Disabled

## bq3285

### UTI - Update Transfer Inhibit

| 7   | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----|---|---|---|---|---|---|---|
| UTI | - | - | - | - | - | - | - |

This bit inhibits the transfer of RTC bytes to the user buffer:

1 = Inhibits transfer and clears UIE

0 = Allows transfer

### Register C

| Register C Bits |    |    |    |   |   |   |   |
|-----------------|----|----|----|---|---|---|---|
| 7               | 6  | 5  | 4  | 3 | 2 | 1 | 0 |
| INTF            | PF | AF | UF | 0 | 0 | 0 | 0 |

Register C is the read-only event status register.

#### Bits 0–3 - Unused Bits

| 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|
| - | - | - | - | 0 | 0 | 0 | 0 |

These bits are always set to 0.

### UF - Update Event Flag

| 7 | 6 | 5 | 4  | 3 | 2 | 1 | 0 |
|---|---|---|----|---|---|---|---|
| - | - | - | UF | - | - | - | - |

This bit is set to a 1 at the end of the update cycle. Reading register C clears this bit.

### AF - Alarm Event Flag

| 7 | 6 | 5  | 4 | 3 | 2 | 1 | 0 |
|---|---|----|---|---|---|---|---|
| - | - | AF | - | - | - | - | - |

This bit is set to a 1 when an alarm event occurs. Reading register C clears this bit.

### PF - Periodic Event Flag

| 7 | 6  | 5 | 4 | 3 | 2 | 1 | 0 |
|---|----|---|---|---|---|---|---|
| - | PF | - | - | - | - | - | - |

This bit is set to a 1 every  $t_{PI}$  time, where  $t_{PI}$  is the time period selected by the settings of RS0–RS3 in register A. Reading register C clears this bit.

### INTF - Interrupt Request Flag

| 7    | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|------|---|---|---|---|---|---|---|
| INTF | - | - | - | - | - | - | - |

This flag is set to a 1 when any of the following is true:

AIE = 1 and AF = 1

PIE = 1 and PF = 1

UIE = 1 and UF = 1

Reading register C clears this bit.

### Register D

| 7   | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----|---|---|---|---|---|---|---|
| VRT | - | - | - | - | - | - | - |

Register D is the read-only data integrity status register.

#### Bits 0–6 - Unused Bits

| 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|
| - | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

These bits are always set to 0.

### VRT - Valid RAM and Time

| Register D Bits |   |   |   |   |   |   |   |
|-----------------|---|---|---|---|---|---|---|
| 7               | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| VRT             | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

1 = Valid backup energy source

0 = Backup energy source is depleted

When the backup energy source is depleted (VRT = 0), data integrity of the RTC and storage registers is not guaranteed.

## Absolute Maximum Ratings

| Symbol              | Parameter                                                                           | Value       | Unit | Conditions                             |
|---------------------|-------------------------------------------------------------------------------------|-------------|------|----------------------------------------|
| V <sub>CC</sub>     | DC voltage applied on V <sub>CC</sub> relative to V <sub>SS</sub>                   | -0.3 to 7.0 | V    |                                        |
| V <sub>T</sub>      | DC voltage applied on any pin excluding V <sub>CC</sub> relative to V <sub>SS</sub> | -0.3 to 7.0 | V    | V <sub>T</sub> ≤ V <sub>CC</sub> + 0.3 |
| T <sub>OPR</sub>    | Operating temperature                                                               | 0 to +70    | °C   | Commercial                             |
| T <sub>STG</sub>    | Storage temperature                                                                 | -55 to +125 | °C   |                                        |
| T <sub>BIAS</sub>   | Temperature under bias                                                              | -40 to +85  | °C   |                                        |
| T <sub>SOLDER</sub> | Soldering temperature                                                               | 260         | °C   | For 10 seconds                         |

**Note:** Permanent device damage may occur if **Absolute Maximum Ratings** are exceeded. Functional operation should be limited to the Recommended DC Operating Conditions detailed in this data sheet. Exposure to conditions beyond the operational limits for extended periods of time may affect device reliability.

## Recommended DC Operating Conditions (T<sub>A</sub> = T<sub>OPR</sub>)

| Symbol          | Parameter           | Minimum | Typical | Maximum               | Unit |
|-----------------|---------------------|---------|---------|-----------------------|------|
| V <sub>CC</sub> | Supply voltage      | 4.5     | 5.0     | 5.5                   | V    |
| V <sub>SS</sub> | Supply voltage      | 0       | 0       | 0                     | V    |
| V <sub>IL</sub> | Input low voltage   | -0.3    | -       | 0.8                   | V    |
| V <sub>IH</sub> | Input high voltage  | 2.2     | -       | V <sub>CC</sub> + 0.3 | V    |
| V <sub>BC</sub> | Backup cell voltage | 2.5     | -       | 4.0                   | V    |

**Note:** Typical values indicate operation at T<sub>A</sub> = 25°C.

## bq3285

### DC Electrical Characteristics ( $T_A = T_{OPR}$ , $V_{CC} = 5V \pm 10\%$ )

| Symbol     | Parameter                                      | Minimum | Typical  | Maximum | Unit    | Conditions/Notes                                                                                 |
|------------|------------------------------------------------|---------|----------|---------|---------|--------------------------------------------------------------------------------------------------|
| $I_{LI}$   | Input leakage current                          | -       | -        | $\pm 1$ | $\mu A$ | $V_{IN} = V_{SS}$ to $V_{CC}$                                                                    |

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

DW (R-PDSO-G24)

PLASTIC SMALL OUTLINE

- NOTES:
- A. All linear dimensions are in inches (millimeters). Dimensioning and tolerancing per ASME Y14.5M-1994.
  - B. This drawing is subject to change without notice.
  - C. Body dimensions do not include mold flash or protrusion not to exceed 0.006 (0,15).
  - D. Falls within JEDEC MS-013 variation AD.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.

**Стандарт  
Электрон  
Связь**

Мы молодая и активно развивающаяся компания в области поставок электронных компонентов. Мы поставляем электронные компоненты отечественного и импортного производства напрямую от производителей и с крупнейших складов мира.

Благодаря сотрудничеству с мировыми поставщиками мы осуществляем комплексные и плановые поставки широчайшего спектра электронных компонентов.

Собственная эффективная логистика и склад в обеспечивает надежную поставку продукции в точно указанные сроки по всей России.

Мы осуществляем техническую поддержку нашим клиентам и предпродажную проверку качества продукции. На все поставляемые продукты мы предоставляем гарантию .

Осуществляем поставки продукции под контролем ВП МО РФ на предприятия военно-промышленного комплекса России , а также работаем в рамках 275 ФЗ с открытием отдельных счетов в уполномоченном банке. Система менеджмента качества компании соответствует требованиям ГОСТ ISO 9001.

Минимальные сроки поставки, гибкие цены, неограниченный ассортимент и индивидуальный подход к клиентам являются основой для выстраивания долгосрочного и эффективного сотрудничества с предприятиями радиоэлектронной промышленности, предприятиями ВПК и научно-исследовательскими институтами России.

С нами вы становитесь еще успешнее!
